## **INTERNATIONAL INSTITUTE FOR POPULATION SCIENCES**

**Vision:** “To position IIPS as a premier teaching and research institution in population sciences responsive to emerging national and global needs based on values of inclusion, sensitivity and rights protection.”

**Mission:** “The Institute will strive to be a centre of excellence on population, health and development issues through high quality education, teaching and research. This will be achieved by (a) creating competent professionals, (b) generating and disseminating scientific knowledge and evidence, (c) collaboration and exchange of knowledge, and (d) advocacy and awareness.”

## **Preface and Acknowledgements**

The District Level Household and Facility Survey-4 (DLHS-4) is a nationwide survey covering 640 districts from 36 States and Union Territories of India. This is the fourth round of the district level household survey which was conducted during 2012-13. The Survey was funded by the Ministry of Health and Family Welfare, Government of India.

At the outset, we acknowledge our sincere gratitude to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for conducting District Level Household and Facility Survey-4 (DLHS-4) in India. We would also like to take this opportunity to acknowledge Shri Bhanu Pratap Sharma, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for his advice, suggestions and support. Our special thanks are due to Shri Lov Verma and Shri Keshav Desiraju former Secretaries, Ministry of Health and Family Welfare (MoHFW), Government of India, for providing overall guidance and support extended to the project. We gratefully acknowledge the active involvement, assistance, help, co-operation and suggestions received time to time from Shri C.R.K. Nair, Additional Director General, Dr. Rattan Chand, the Chief Director and Shri Biswajit Das, Director-Statistics Division, Ministry of Health and Family Welfare, Government of India. We also extend our thanks to Smt. Madhu Bala, former Additional Director General and Shri Rajesh Bhatia, former Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their support from time to time.

We gratefully acknowledge the NIHFW, New Delhi, especially Dr. M. M. Misro, Dr. T. G. Srivastava and Dr. Kalpna, for their immense help, assistance, support and coordination with all Partner Institutes to bring out quality DBS results/data. We also acknowledge our sincere gratitude to all Partner Institutes for providing training and support of CAB components and bringing out the quality DBS results.

We sincerely extend our appreciation to HLL Life Care Ltd., New Delhi, for procuring CAB equipments and consumables also supply chain to different states across the country.

Our special thanks are to all the members of Technical Advisory Committee of DLHS-4, particularly Dr. N. S. Shastry, Chairman, Former DG & CEO (NSSO) for their constant involvement and technical inputs and support at various stages of the survey.

We also gratefully acknowledge all members of Sub-Committee on Sampling especially Shri G. C. Manna, Chairman, DDG, CSO, MoSPI for their technical support received from time to time.

Thanks are also due to Dr. Rajiv Mehta and Shri A. K. Mehra former Additional Director Generals at the National Sample Survey Organisations, Kolkata for providing UFS blocks.

We thank Dr. T. K. Roy, Former Director, IIPS, for reviewing the model report and his useful suggestions.

This acknowledgement cannot be concluded without expressing appreciation for the efforts and hard work put in by the field investigators, supervisors, health investigators in collecting data and timely transferring data to IIPS.

Last but not the least, we are grateful and appreciate the efforts of all the respondents who participated and spared their valuable time with us by providing the required information.

**DLHS-4 Coordinators**  
**International Institute for Population Sciences**

## **1. INTRODUCTION AND HOUSEHOLD CHARACTERISTICS**

This state report of Himachal Pradesh pertains to the fourth round of District Level Household and Facility Survey (DLHS-4) 2012-13, following the preceding three rounds undertaken by the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI). In the past (Round-I in 1998-99, Round-II in 2002-04, and Round-III in 2007-08) with the main objective to provide reproductive and child health related database at district level in India. The data from these surveys have been useful in setting the benchmarks and examining the progress of the country after the implementation of RCH programme. In addition, the evidences generated by these surveys have been useful for the purpose of monitoring and evaluation of the ongoing programmes and the aspect of planning of suitable strategies by the central and state governments. In view of the completion of eight years of National Rural Health Mission (2005-12), that it was felt there was a need to focus on the achievements and improvements. The Ministry of Health and Family Welfare, Government of India, therefore initiated the process of conducting DLHS-4 and designated the International Institute for Population Sciences (IIPS) as the nodal agency to carry out the survey. The MoHFW, provided funds for implementation of DLHS-4, guided by a duly constituted Technical Advisory Committee (TAC).

The main objective of District Level Household and Facility Survey-4 (DLHS-4) is to provide maternal and child care (MCH) indicators and prevalence of morbidity for a wide range of common, communicable, non-communicable and lifestyle diseases for the year 2012-13 covering the following aspects:

- Household basic amenities
- Prevalence of morbidity
- Coverage of ante-natal services and immunization services.
- Proportion of institutional/safe deliveries
- JSY Beneficiaries
- Economic burden of delivery
- Contraceptive prevalence rate
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTI / STI and HIV / AIDS
- Infrastructure, manpower, equipments, drugs, services of public health facilities
- Linkage between health facility and MCH indicators

Bilingual questionnaires prepared in Hindi and English language pertaining to Household, Clinical, Anthropometric and Bio-Chemical tests (CAB) and Ever Married Women (age 15-49) were used and canvassed using Computer Assisted Personal Interviewing (CAPI). It was for the first time in the country that large scale demographic and health survey at the district level was successfully carried out by using Computer Assisted Personal Interviewing (CAPI) in DLHS-4. The CAPI software was developed by using MMIC (Multi-Mode Interviewing Capability) tool. Mini laptops were also loaded with CAPI software and bilingual questionnaires and provided to the Field Agencies authorized to carry out the survey with the

designated states. Each team was provided four CAPIs/Mini laptops, one for each investigator. Supervisors were responsible for directly uploading the completed PSU's data to the IIPS, FTP server located in Mumbai on day-to-day basis. The use of CAPI optimized resources were required for transferring the filled questionnaires from field to state office, data entry and received at IIPS. For the first time biomarkers were also used in DLHS-4. The village and health facility questionnaires were canvassed by using paper & pen method in DLHS-4. In the household questionnaire, information on all members of the household and socio-economic characteristics of the household, possessed assets, number of marriages, morbidities and deaths in the household since January 2008, and also drinking water, toilet, drainage and kitchen facilities were collected. The ever-married women questionnaire contained information on women's characteristics, maternal care, immunization and childcare, contraception and fertility preferences, reproductive health including knowledge about HIV/AIDS. The village questionnaire contained information on availability of health, education and other facilities in the village, and whether the facilities are accessible throughout the year. The health facility questionnaire contained information on human resources, infrastructure, equipments, drugs and services. For the first time, a population-linked facility survey has been conducted in DLHS-4. At the district level, all Community Health Centres, Sub-Divisional Hospitals and District Hospitals were covered. Further, all Sub Health Centres and Primary Health Centres which cater to the needs of the population of the selected PSUs were also covered. Fieldwork in Himachal Pradesh for all the 12 districts was conducted during January to July 2013, gathering information from 11,874 households and 9,100 ever married women (15 to 49 years). Table 1.2 provides breakup of PSUs and households by district and rural urban residence.

## **2. SURVEY DESIGN**

DLHS-4 is a district level survey and a multi-stage stratified designed is adopted for selection of representative sample of each district in Himachal Pradesh. Rural and urban areas of a district are considered as natural strata. Wherever applicable, urban in a district is further stratified into million class cities and non-million class cities. For sampling of urban samples, two-stage sampling is used where the primary sampling unit (PSU) is the NSSO urban frame survey (UFS) blocks and second stage sampling unit (SSU) is the household. Urban PSUs are selected by equal probability without replacement and USU selected by circular systematic sampling. Allocation of PSUs to million and non-million class cities is proportional to relative sizes. Distribution of PSUs of a district is proportional to projected urban population of the district. For districts with less than projected 30 % urban population urban, PSUs are oversampled. The sampling frame used for urban sampling is the town and city wise list of NSSO UFS blocks for 2007-08 provided by the SRD Unit of National Sample Survey Organisation (NSSO), Kolkata.

In rural area of each district, sampling design is two-stage sampling with census villages as PSU and household as the second stage sampling unit (SSU). The PSUs are selected by PPS with replacement and SSU are selected by circular systematic sampling. Large selected PSU with more than 300 households are divided into at least three segments in such a way that each segment has by and large the same number of households and two segments are then

selected by SRS. List of villages in a district in Census 2001 are updated by removing villages of 2001 which have been designated as urban in 2007-08 NSSO UFS block list and this serves as the sampling frame for sampling of rural PSUs from a district.

Selection of rural health facilities in DLHS-4 is linked with the sampled rural PSUs. Primary Health Centres (PHC) and Sub Health Centres (SHC) catered to the health care needs of the sampled rural PSUs were included in the Facility Survey (FS) of DLHS-4. All Community Health Centres (CHC), Sub-Divisional Hospitals and District Hospitals are covered under the Facility Survey of DLHS-4.

## 2.1. Sampling Weight

In generating district level demographic indicators, sample weight for household, women and children will be used. The weights for a particular district are based on three selection probabilities

$f_1^i$ ,  $f_2^i$  and  $f_3^i$  pertaining to  $i^{\text{th}}$  PSU of the district. These probabilities are defined as

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ PSU in a district}$$

$$= (n_r * H_i) / H,$$

Where  $n_r$  is the number of rural PSU to be selected in a district,  $H_i$  refers to the number of household in the  $i^{\text{th}}$  PSU and  $H = \sum H_i$ , total number of household in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU (in case the } i^{\text{th}} \text{ selected PSU is segmented)} = \frac{\text{(Number of segments selected after segmentation of PSU)}}{\text{(number of segment created a PSU)}}$$

The value of  $f_2^i$  is to be equal to one for un-segmented PSUs.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= (25 * HR_i) / HL_i$$

Where  $HR_i$  is the household response rate of the  $i^{\text{th}}$  sampled PSU and  $HL_i$  is the number of households listed in  $i^{\text{th}}$  PSU in a district.

For urban PSU,  $f_1^i$  is computed either as the ratio of number of UFS blocks included in the sample to the total number of UFS blocks of the district.

The probability of selecting a household from the district works out to be

$$f^i = f_1^i * f_2^i * f_3^i$$

The non-normalized weight for the  $i^{\text{th}}$  PSU of the district is,  $w^i = 1/f^i$  while the normalized weight used in the generation of district indicators for the  $i^{\text{th}}$  district would be

$$= \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i$$

Where  $n_i$  is the number of households interviewed in the  $i^{\text{th}}$  PSU. The weight for women and children are computed in the similar manner considering corresponding response rate.

### **3. SURVEY INSTRUMENTS**

The main instrument for collection of data in DLHS-4 was a set of structured questionnaires, namely, household, ever married woman, and village questionnaires as components of household survey. In the facility, separate questionnaires are used for Sub-Health Centre (SHC), Primary Health Centre (PHC), Community Health Centre (CHC), Sub-Divisional Hospital (SDH) and District Hospital (DH). Household and ever married women questionnaires are bilingual, with questions in both Hindi and English languages.

**3.1 Household Questionnaire:** - The household questionnaire starts with listing of all usual residents in each sample household including visitors who had stayed the night before the interview. The listing of usual resident members is used for identification of eligible respondents for ever married women and CAB (Clinical, Anthropometric and Biochemical) tests. For individual household member information on age, sex and marital status, relationship to the head of the household and education were collected. Marriages and deaths to members of household were also recorded. Efforts were made to get information about maternal deaths. Information were also collected on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, religion and caste of household head and ownership of durable goods in the household.

An added feature of household questionnaire of DLHS-4 is the collection of data on disability status, injury, acute and chronic illness for all members of the household.

Clinical, Anthropometric and Biochemical (CAB) tests: An important component of household questionnaire is the collection of biomarkers of eligible household members for the first time on a large scale demographic and health survey in the country at district level. This includes weight and height for all household members of age one month and above, Haemoglobin level for all household members aged 6 months and older, random blood sugar test and blood pressure measurements for all household members aged 18 years and above.

**3.2 Ever Married Woman's Questionnaire:-** The respondents for the ever married woman's questionnaire are ever married women in 15-49 years of age living in the sampled households. Details on age, age at marriage, place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Accounts of ante-natal checks, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use, sex preference of children and fertility intentions were recorded. For the recent births, immunizations status of children was collected either from the immunization card or asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTI/STI and HIV/AIDS by source and treatment seeking behavior of RTI/STI.

**3.3 Village Questionnaire:-** This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at

village level. Functioning of village committees and utilization of fund were additionally collected from the sampled villages. Information relating to implementation and beneficiaries of various government programmes on girl child, maternal care, sanitation, food security, employment generation, and women's empowerment are also gathered as part of village information.

**3.4 Facility Questionnaire:-** In the facility survey, the information collected at the SHC level were availability of human resources, physical infrastructure, equipments and essential drugs and MCH service provided in one month preceding the survey. From the PHC, status of availability for 24x7 facility and services for delivery and new born care were collected. Additional information collected at PHC level were availability of Lady Medical Officer, functional Labour Room, Operation Theater, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that were collected for Community Health Centre (CHC) includes availability of 24X7 services for delivery and new born care, status of in-position clinical, supporting and Para-medical staff, availability of specialists trained for NSV (Non-Scalpel Vasectomy), emergency obstetric, MTP, new born care, treatment of RTI / STI, IMNCI, ECG etc. Physical infrastructure of CHC such as water supply, electricity, communication, waste disposal facilities, OT, Labour Room and availability of residential quarters for medical doctors were also collected in the facility survey. From the Sub-Divisional and District Hospitals status of availability of essential laboratory and ambulance services, emergency obstetric care service, availability of specialists, nurses, paramedics and technicians either on regular or contractual basis were collected in addition to infrastructure, provision for bio-medical and waste disposal and availability of residential quarters for doctors, nurses and staff. The mode of collection of information for health facilities is directly asking to the concerned officials, physical inspection and recording from relevant registers.

### **3.5 Sample Implementation**

The field implementation starts with the preparation of location and layout maps of sampled PSUs in rural areas and obtaining map of sampled NSSO UFS blocks in urban areas. This is followed by preparation of list of households which served as the sampling frame for selection of representative households and it involved mapping and listing of structures and households for each sampled primary sampling unit (PSU) following the preparation of location and layout maps. The mapping and listing was carried out for each PSU by a team comprising of a mapper, a lister and a supervisor. A PSU in rural area is a village or part of a village or a group of small villages and it is NSSO UFS block in an urban area.

From the sampling frame of households prepared by mapping and listing, a sample of 28 households were selected by circular systematic sampling. Household and ever married women's questionnaires were canvassed by a team of 3 female and one male investigators, one supervisor and two health investigators were assigned for collection of CAB information. For quality assurance, field teams were monitored constantly by Project Officers, Officials of PRC, MoHFW, and Partner Institutes who facilitates DBS testing. Time to time DLHS-4 Project Coordinators of IIPS also made field visits to check and provide support to field teams.

## **4. DEMOGRAPHIC BACKGROUND OF HIMACHAL PRADESH**

Basic demographic indicators of Himachal Pradesh and its districts as of Census 2011 are shown in Table 1.1. The population of the state in Census 2011 is enumerated as 68 million and population of the state is concentrated mainly in the districts of Kangra, Mandi, Shimla, Solan and Sirmaur. The decadal growth rate of the state during 2001-2011 Census is 12.9 percent. Decadal growth rate during this period is 16.2 percent in Una, it is the highest in the state and nearly 15.9 percent in Solan district. The sex ratio of the state is 972 females per 1000 males, it is lowest (819) in Kinnaur and highest (1095) in Hamirpur. The overall literacy rate is 82.8 percent and literacy rate is 89.5 percent for males and 75.9 percent for females.

### **4.1 Sample Coverage**

DLHS-4 surveyed a total of 465 primary sampling units (PSUs) covering 11,874 households with 88.3 percent response rate and 9,100 ever married women in reproductive age 15-49 years with 93.7 percent response rate. Table 1.2 shows the number of PSUs, households and ever married women interviewed and corresponding response rates by districts. Household response rate in the district varies from 57.7 to 96.6 percents while that for the ever married women it is from 75.7 to 99.6 percents.

### **4.2 Village Facilities**

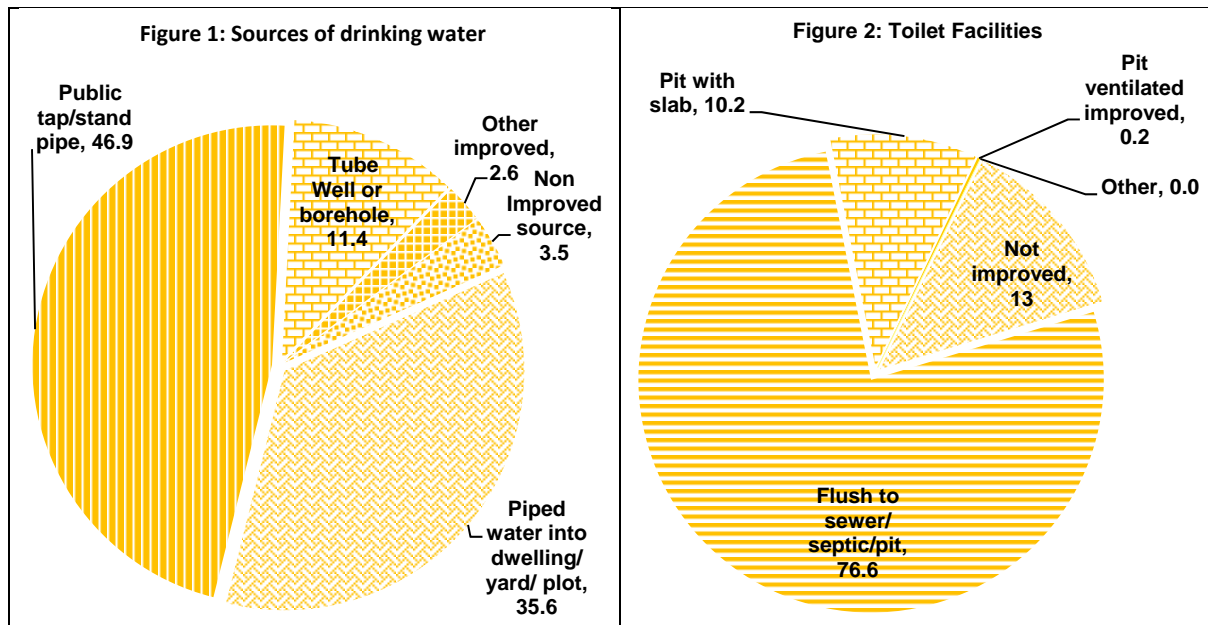

Number of villages surveyed in Himachal Pradesh is 421 and 35 villages are surveyed from most of the districts. Most villages (90%) have a primary school within the village (Table 1.3). In 51.9 percent of the villages, there is Sub-Health Centre (SHC) (Table 1.4a). Out of total 421 villages 77.7 percent (327 villages) have beneficiaries of ICDS, while 92.6 percent have JSY beneficiaries, but 84.8 percent (390 villages) have beneficiaries of JSSK (Table 1.4b). As can be seen from Table 1.15 almost all sampled villages (99%) have Anganwadi centre, 63.7 percent have access to any government health facility but about 19.8 percent of the sampled villages have Primary Health Centre (PHC) and 68.3 percent of the villages have Village Health Nutrition and Sanitation Committee (VHNSC).

### **4.3 Household Amenities and Characteristics**

As regards housing condition can be noted from table 1.6 (a), 57 percent of the surveyed households live in pucca house, 12 percent in kachha house and 30 percent in semi-pucca house. As many as 99.7 percent of households have electricity connection, 63 percents of households use woods for cooking while 36 percent use LPG, 89 percent of households have mobile, 91 percent owned television, 6.5 percent owned bicycle while 19 percent owned motor cycle/ scooter and 8.2 percent owned car/jeep/van.

The sources of drinking water are shown in figure 1 and it is noted that 11.4 percent of households are using tube well or borehole water for drinking and 83 percent of households are using piped water into dwelling/yard/plot and public tap/stand pipe for drinking. As can be seen from figure 2 households which do not have access to improved clean toilet constitute 13 percent of the total surveyed households and 77 percent of the households have access to improved flush/septic/pit toilets.

Table 1.6 (b) provides household access to electricity, drinking water, toilet and cooking gas and type of house by districts. The mean household size of the state is 4.1 while it is 4.2 in rural and 3.5 in urban areas (Table 1.7). One member households constitute 6.2 percent of all surveyed households, 86.2 percent household heads are males, median age of the head of the households is 50 years. Hindu are majority among households (92.5%) and significant shares (22.8%) of the household heads are scheduled castes (SC) and 50.7 percent of household heads are from the general castes.

The age-sex composition of the population of Himachal Pradesh is depicted in the population pyramid shown in figure 3. The pyramid is characterized by a shrinking base indicating declining trend in fertility, more females than males in 15-49 years and at older ages.

Table 1.8 provides differential in age-sex structures of rural and urban population of the state. As evident from table 1.9 there is sizeable proportion of unmarried males and females in 20-

29 years and another distinctive feature is that are more widowed/divorced/separated among females than among males. The mean age at marriage for girls is 22.3 years while it is 26.2 years among boys. Mean age marriage for girls and boys by districts are shown in table 1.10. Only 3.5 percent marriage among girls is below the legal age of 18 years and 3 percent of the boys got married below the legal age of 21 years. Tables 1.11 through 1.13 provide details about years of schooling of sampled household members by age, sex, caste and religion by rural-urban residence. Among females 7 years and older 0.9 percent are non-literate and corresponding figure among males is 0.4 percent. More among females, 43.1 percent have 11 or more years of schooling as compared to 40.1 percent among males. Regardless of sex individuals about 31.5 percent of the literate population has less than five years of schooling. The non-literate persons are less in urban than in rural and more persons have 11 or more years of schooling than among rural residents. Table 1.14 provides rate of current school attendance by age, residence, religion and castes.

Figure 4 shows the school attendance by age, 6-11 years and 12-17 years, the stage of primary and secondary education respectively and sex. The state achieved 99.8 percent school attendance among 6-11 years children and 99.1 percent among 12-17 years suggesting the existence of dropout at the secondary level. There is no evidence of sex differential in school attendance among 6-11 years but for 12-17 years school attendance among females is 98.9 percent as compared 99.3 percent among males.

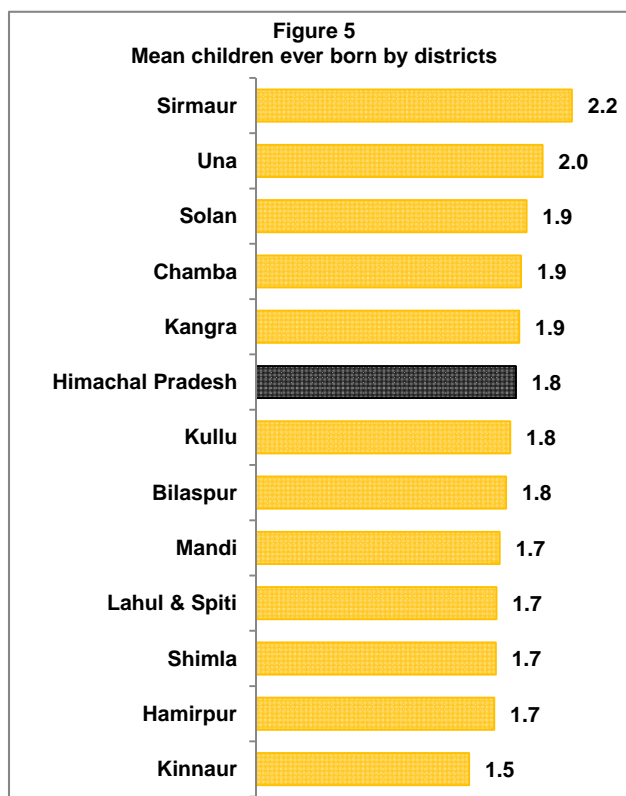

## 5. CHARACTERISTICS OF WOMEN AND FERTILITY

The distribution by age of women surveyed remains almost constant above age 25 years and above in both rural and urban settings. Age at consummation of marriage is below 18 years is found to be low only 12.4 percent of ever-married sampled women between 15-49 years irrespective of residence background. In rural, 12.7 percent of surveyed women reported their age at consummation of marriage below 18 years. In urban area, 9.2 percent of surveyed women reported that they had started living with husband before reaching at age 18 years (Table 2.1). There are more non-literate women in rural (14%) than in urban areas (7.6%). Non-literate husbands are less by 6.3 percentage points compared to non-literate wives/women in rural areas. Around 13 percent of women are non-literate whereas 52 percent of women are educated at least for 10 years. The proportion of husbands with 10 years or more schooling is 65.6 percent in rural, 84.7 percent in urban and 67.6 percent as combined.

Nearly half of the ever-married women (48.5%) were married for 15 years or more with a marginal difference between rural and urban settings. In case of less than 15 years of marital duration, the distribution of ever-married women in the categories of less than 5 years, 5-9 years and 10-14 years marital duration are almost uniform, with around 18 percent in each category. The proportion of women belonging to Hindi has been highest and found to be 94.4 percent followed by 3.5 percent Buddhist/Neo Buddhist. The proportion of Hindu women is slightly higher in urban area (95.9%) as compared to rural (94.3%). The percent distribution of women by castes/tribes is skewed towards 'Others' (51.6%) followed by women belonging to scheduled castes (22.7%) and Other Backward Classes (14.6%).

The percent distribution of women by castes/tribes is skewed towards 'Others' (51.6%) followed by women belonging to scheduled castes (22.7%) and Other Backward Classes (14.6%). The percent of women who belong to 'Others' group is higher (68.6%) in urban than in the rural (49.7%). It is to be noted that 23.6 percent of surveyed women in rural area and 15 percent in urban area belong to scheduled castes.

Table 2.2 shows the distribution of years of schooling among surveyed women by background characteristics. The percentage of non-literate women (5.9%) is found to be lowest in the age group 20-24. Nearly 14 percent rural women and 7.8 percent urban women reported as non-literate in the survey. Relatively higher proportion of Muslim (36.5%) and scheduled tribe women (19.3%) are found to be non-literate than other religion or cast groups respectively. Slightly above one-fourth of surveyed women (27.3%) had 11 or more years of schooling in Himachal Pradesh comprising 25 percent in rural and 48.4 percent in urban. In contrast, 16 percent of Muslim and 18 percent of scheduled caste women have 11 or more years of schooling. It is to be noted that at least 14.3 percent of women with 0-5 years of schooling and 6.7 percent of 6-8 years of schooling reported that their husband is non-literate. Other than scheduled castes and Muslim women, the distribution is skewed towards 9 and above years of schooling in Himachal Pradesh. The percentage is as high as 33 percent of women from 'other' castes had 11 or more years of schooling.

### 5.1 Birth Order

Out of the total births since Jan 1, 2008 to ever-married women, around 91 percent births comes from rural area and the rest 9 percent from urban area. Almost 48 percent of them belong to women in the age group 25-29 followed by 28.7 percent from women in the age group 20-24 (Table 2.3). The distribution of these births by religion shows that 96.3 percent births belong to Hindu and only 1.7 percent to Muslim and rest belong to other than these two religions. The distribution of births by castes/tribes indicates that births from the 'Others'

castes contribute maximum 49 percent followed by scheduled castes (24.7%) and Other Backward Classes (18%). Out of the total births since Jan 1, 2008 to ever-married women, 45.5 percent were of second or higher order births and the corresponding figures are 57.8 percent and 83.5 percent respectively for non-literate and women with less than 5 years of schooling (Table 2.3).

The births of second and higher order are more in proportion among ever-married women aged 15-49 who are from rural area (46.1%), belonging to Muslim (69.5%), belonging to scheduled caste (48.8%), and as, compared to ever-married women educated at least up to 10 years (41.2%), and those belonging (44.1%) to other castes (Table 2.3). Table 2.4 shows that the proportion of second and higher order births is the highest in Una district (53.3%) and the lowest in Kinnaur district (26%). The proportion of first order birth has crossed the mark of 65 percent in Mandi, Shimla and Kinnaur districts.

## **5.2 Mean Children Ever Born**

Mean children ever born (CEB) to ever-married women aged 15-49 years is 1.8 with marginal differential by residence, while it is 2.2 for non-literate and 1.5 to women with at least 10 years of education. The completed fertility measured in terms of average children ever born to ever-married women aged 40-49 years is nearly 2.3. The differential by castes/tribes has not seen clearly. Similarly, differential by religion are not wide and ranges between 2.2 children for Muslim to 1.8 for Hindu. The state level estimates for mean children ever born by sex of children are also shown. It indicates that on an average an excess of 0.21 male children to per female children ever born to ever-married women aged 15-49 years in the state as a whole. The sex differentials in mean children ever born to ever-married women aged 15-49 years is found to be higher than state average in the above age 45 years, Rural, less than 5 years educated and scheduled castes women. In case of women 40-49 years, the sex differential in mean children ever born is marginal or in the range of state level for almost across all socioeconomic background characteristics (Table 2.5).

The mean children ever born to ever-married women by district of Himachal Pradesh is shown in figure 5, it varies from 2.2 children in Sirmaur district to 1.5 children in Kinnaur district, while the state average is 1.8 children.

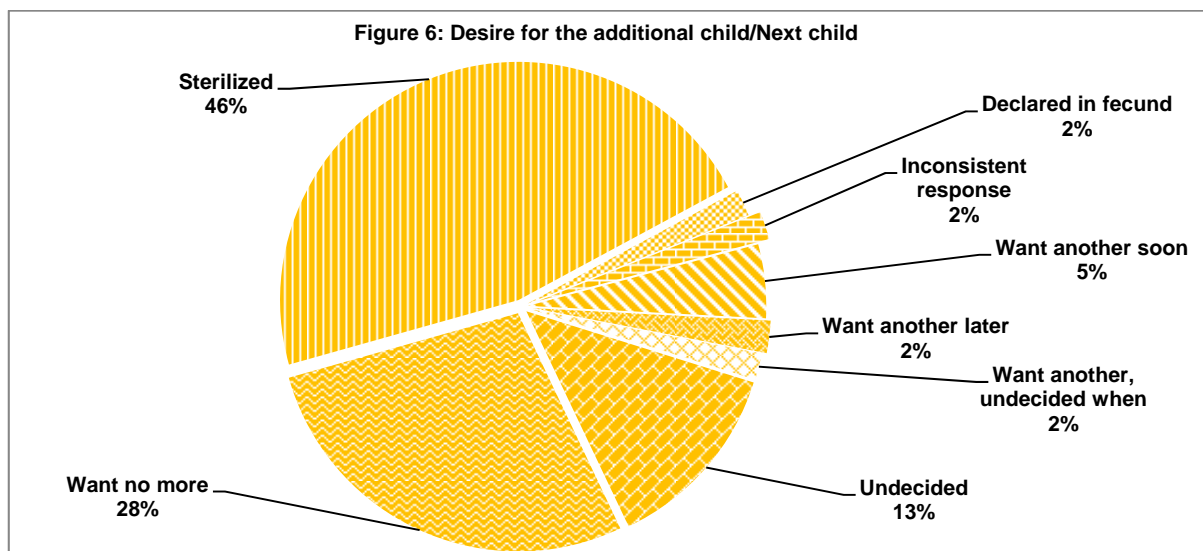

In Himachal Pradesh, most of the outcomes (97.6%) of pregnancies which occurred since Jan 1, 2008 to currently married women aged 15-49 years turned to be live birth. Only 1.4 percent of the pregnancies outcomes are reported as spontaneous abortion. Percentage of pregnancies that resulted in induced abortion is 0.4 percent for the state as a whole. Interestingly, age, education and castes/tribes of women depict a large variation in the percentage of pregnancies resulted as spontaneous abortion. For example, women in the age group below 25 years show large percentage of spontaneous abortion (1.8%). The highest rate of spontaneous abortion is estimated for women educated 5-9 years across all educational background of women. Women belong to Scheduled castes (1.2%), Scheduled tribe (1.2%), and 'Others' castes (1.7%) tend to have higher rate of spontaneous abortion than the state average. Similarly, percentage of induce abortions among the outcomes of pregnancies in the survey reference period is found to be very negligible or nearly zero percent for almost across

the all socioeconomic background characteristics (Table 2.6). Percentage of pregnancies resulted into spontaneous abortions varies from 0.0 percent in district Chamba to 4.2 percent in district Kinnuar. The other districts also show not seen much rate of spontaneous abortion Kullu (3.6%), 1.2 percent each in Srimaur , Shimla (1.1%) followed by Una district (2.8%). The induced abortion rate is zero in almost all districts except Una district of Himachal Pradesh. District Una tends to have the lowest level of outcomes (93.9%) as live birth from pregnancies since January 1, 2008 which should draw attention of reproductive and child health programme managers (Table 2.7).

### 5.3 Fertility Intention and Sex Preferences for Additional Child

Fertility preferences of currently married women in terms of desire for an additional child, timing to have and preferred sex of desired additional child by number of living children are given in Table 2.8. Among those with no living children, about one-fourth of women (24.1%) wanted a child soon (within the next two years) and 7 percent want a child two or more years later. Among the currently married women aged 15-49 with one living child, 7.1 percent of wanted an additional child soon i.e. within two years. Most of the currently married women with two living children are either sterilized (60.2 %) or want no more children (31.9 %). In addition, not more than 1 percent of women desired another child once they attain two or more surviving children.

Figure 6 depicts the fertility preference of all currently married women regardless of number of living children. Twenty eight percent of currently married women want no more children, five percent want additional child soon, thirteen percent are undecided about having and additional child and 46 percent have undergone sterilization. Among the currently married women with no living children but want an additional child, 59 percent reported that sex of

the child does not matter, 36.9 percent say it is up to God while 2.5 and 1.6 percent want to have an additional child as a boy and a girl respectively. Among those who had at least one living child and wanted to have another child, the percentage of women who were able to tell about preferred sex of additional child is quite high (19.3% wanting boy and 12.5% wanting girl). With increasing number of living children, longing for an additional male child

becomes more and more magnified from 19.3 percent among currently married women with one child to 62.5 percent among currently married women with three living children (Table 2.8).

## 6. MATERNAL HEALTH CARE

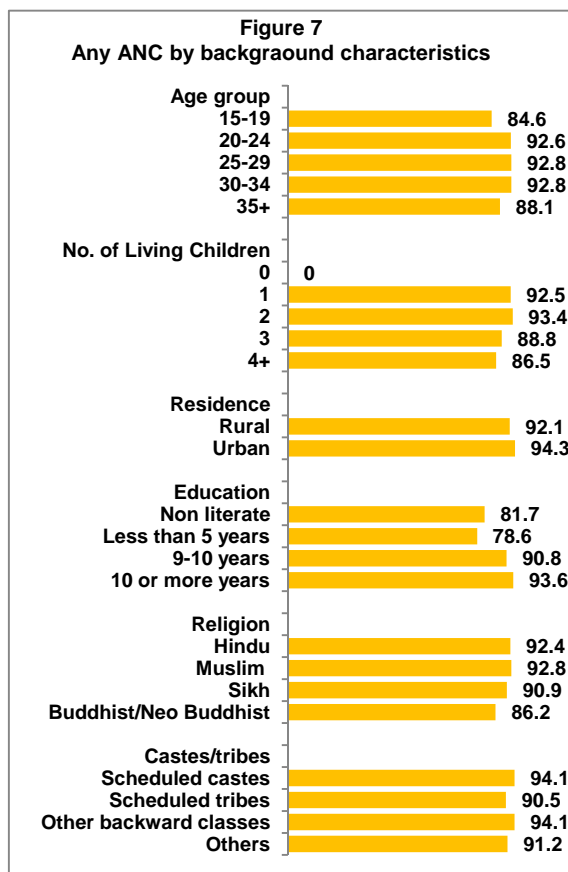

Maternal Health Care package of RCH components focused more on ANC is the main programme under NRHM/NHM programme. The Maternal health care activities are implemented to strengthen and fulfill the RCH goals. ANC services provided by medical and paramedical professionals are comprises of regular physical checks with weight, height and blood pressure measure, Haemoglobin level test, consumption of IFA, Tetanus (TT) injection and growth status and position of foetus. These primary services are made compulsory to be provided during the ANC check up from health facility. At least four checkups are made compulsory to complete the full ANC course in order to prevent and protect women from pregnancy related complication faced during the pregnancy and till the delivery. Janani Suraksha Yojna (JSY) is a scheme which is implemented in health facilities under NRHM/NHM to promote the institutional delivery and post natal care to prevent from maternal deaths.

### 6.1 ANC by Selected Background Characteristics

In Himachal Pradesh 92.3 percent of the women had received at least one antenatal care (ANC) service during the pregnancy of their last birth in the three years period preceding the survey. Utilisation of government health facility for ANC care is more than 89.4 percent compare to 10.9 percent of private health facility and 5.3 percent of community based services (Table 3.1).

Any ANC coverage by selected background characteristics are illustrated in Figure 7. Any ANC received among the non-literate are 81.7 percent as against 93.6 percent among the women educated for 10 or more years. There is marginal rural-urban gap of (2.2%) in availing any ANC. Women who had received ANC with one living children is 92.5 percent whereas women with 4 and above living children is 86.5 percent.

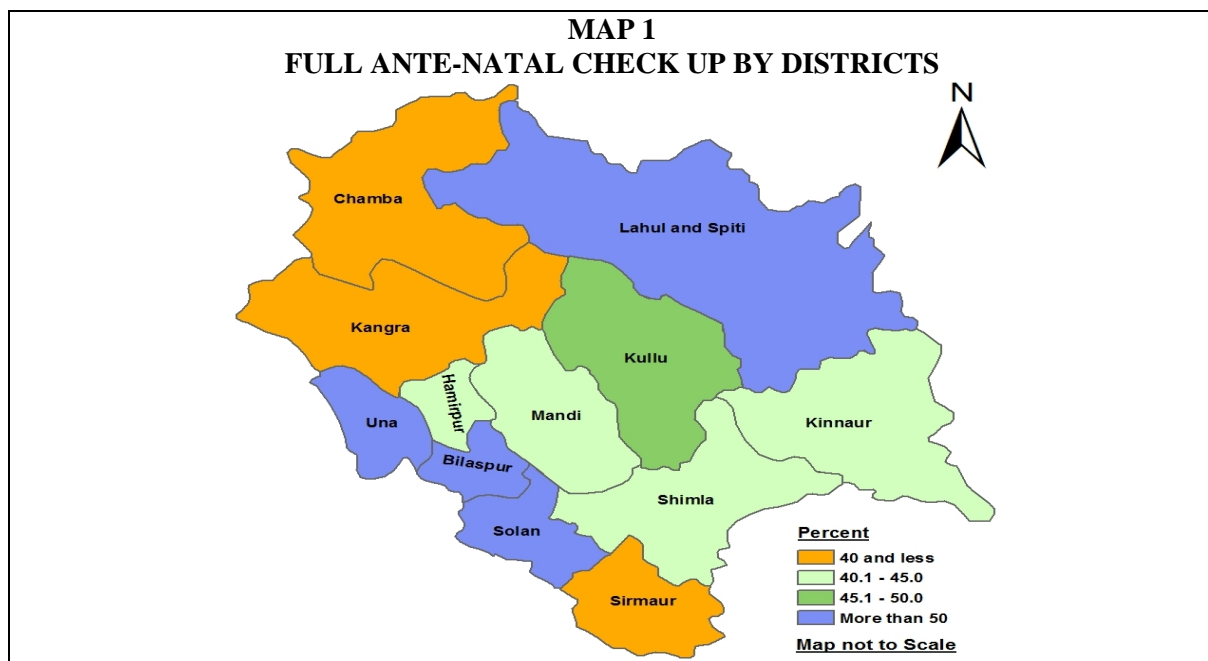

The coverage of any ANC is highest in Hamirpur district (98.7%), nearly universal coverage in solan, kullu and una (96 to 98.7) and lowest in Chamba district (76%). Majority of women from Lahul & Spiti, Mandi, Hamirpur, Kinnaur and Chamba district are availed ANC care from government health facilities (93.3 to 97.2%) which is the highest in the state. The lowest ANC coverage in

government health facilities was in Una District (79%). The DLHS-4 data reveals that more women availed from government health facilities for ANC as compare to private health facilities (Table 3.2).

The specific components of ANC checkup which are supposed to be received by the women during the pregnancy were asked to response. The proportion of women who received weight, height and blood pressure measurement, blood and urine tested, abdomen examined and sonography/ ultrasound test done are 84.3, 63.3, 70.3, 70.7, 71, 60.2 & 72.2 percent respectively, (Table no. 3.3). One important features of ANC check up in Himachal Pradesh in case of ultrasound test done is high among women who are having two children than four or more living children (74.2% and 62.5% respectively), having ten years of education (75.7%), rural-urban residence (70.6% and 87.7% respectively), and Muslim and Buddhist/Neo Buddhist religion (80% and 75%). The women from scheduled tribe caste are the highest (77%) as compare to all others castes. The detail is shown in Table.3.3.

The proportion of women who had received at least three ANC (58.3 %) and the women who had received first ANC in the first trimester of the pregnancy (58.5%) (Table 3.5 A). The proportion of women who had three ANC are highest among women who have two living children (60%), having 10 years and above education (61%), Rural residence (58.4%), other caste (61.5%). There is no much difference by religion and age group between 15 - 35 years. The women who had full ANC (i.e. at least 3 ANC visits with 100+ IFA tablets/ Syrups consumed at least 1 TT) in Himachal Pradesh is 41.1 percent. But 66.7 percent of women had 2 TT+ injections against 58.6 percent who had consumed 100+ IFA tablets/Syrups. The proportion of women who had received full ANC is highest in Lahul & Spiti district (63.2%) and lowest is 20 percent in Sirmaur district (Table 3.6). District wise variation in coverage of full ANC is shown in the Map 1. The proportions of women who consumed 100 IFA tablets/syrup and received at least one TT injections are 58.6 percent and 89.7 percent respectively in Himachal Pradesh during DLHS-4 (Table 3.6).

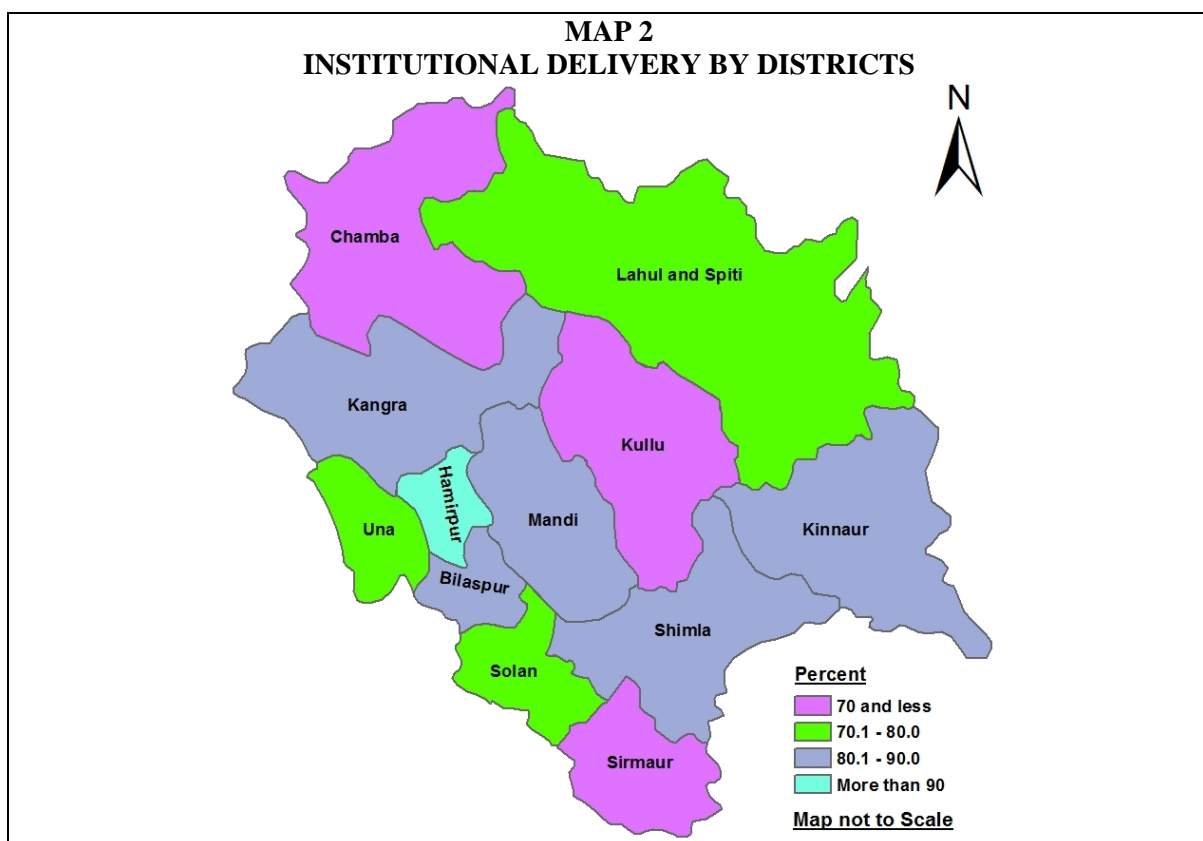

## 6.2 Institutional Delivery

In Himachal Pradesh, the institutional delivery increased from 32 percent in DLHS-1 (1998-99) to 45 percent in DLHS-2 (2002-04) to 48 percent in DLHS-3 (2007-08) and further substantially increased to 78 percent in DLHS-4 (2012-13). The institutional delivery in Himachal Pradesh is presented in the Figure 8.

Eighty eight percent of deliveries in the three years period preceding the survey which results either in still or live births were in both government and private health facilities, (Table 3.7). The proportion of women having background of ten years or more education (81.5%) and having one living child (82.3%) are going for institutional delivery. The percentage of institutional delivery ranges from 92.8 percent in Hamirpur and 57.4 percent in Chamba districts (Table 3.9). Around 93.4 percent of Skilled Birth Attendant (SBA) delivery shows that safe delivery is practiced in Himachal Pradesh. The home delivery cases (21.4%) who are assisted by skilled persons is only 15.6 percent. The mean delivery cost in Himachal Pradesh ranges with a maximum of Rs.11, 097 in Mandi district and minimum is Rs.3, 483 in Kinnaur district. In Himachal Pradesh, out of the 12 districts, nearly half districts are having the institutional delivery 80 percent and above and in remaining 6 districts the percentage is varies from 57.4-78.7 percent of Institutional delivery which are not low. District wise variation in Institutional delivery is presented in the Map 2.

The two districts having the lowest institutional delivery are Chamba (57%) and Srimaur (67%).

In Himachal Pradesh, 20.8 percent of institutional delivery used ambulance and 50 percent jeep or car for transportation of delivery with an average cost of Rs.1,074. The used of ambulance for transportation for institutional delivery was low among women with background of having 4 and above living children (9.8%), 10 or more years of education (20.3%), Buddhist (17.4%) and scheduled tribe caste (16.6%). The mean delivery cost is Rs.5,585 in government health facilities and Rs.13,373 in private health facilities. There is a large variation of institutional delivery cost compare to government and private health facilities.

The JSY financial assistance for institutional delivery had benefitted to 22.7 percent and Home delivery 7.4 percent (Table 3.8). The highest benefitted women for institutional delivery in rural residence (23.7%), having two living children (23.8%), Hindu (22.8%) and scheduled castes (36.7%).

### **6.3 Complications during Pregnancy, Delivery and Post-delivery Period**

Women who either do not take ANC or take an incomplete course of ANC are exposed to the risk of maternal death. In Himachal Pradesh as much as 39.8 percent women who had still/live births in the three years preceding the survey had some complications during pregnancy (Table 3.6). Out of 12 districts, in 9 districts women faced high pregnancy complication percentage ranges from 68.9 percent in Hamirpur to 32.7 percent in Kangra. The remaining 3 districts' women faced pregnancy complication ranges from 16.8 percent in Shimla to 27.5 percent in Lahul & Spilit. Fourty percent of women who had reported complication during pregnancy had sought treatment (62%) for the problem in Himachal Pradesh (Table 3.15).

Around 46 percent of women in Himachal Pradesh had faced at least one delivery complication. The main type of delivery complications experienced by women who had still or live births in the three years period preceding the survey are mainly obstructed labour (38.9%), premature labour (64.9 %), prolonged labour (32.3%), excessive bleeding (30%) and convulsion or high Blood pressure (17.1%). Delivery complication is higher among who undergone by caesarean (62.7%) compared to normal delivery (43.6%) (Table 3.11). In all the districts of Himachal Pradesh, Hamirpur district is highest proportion of women had a delivery complication (81.6%) and is lowest in Chamba (22.5%) (Table 3.15).

Women in Himachal Pradesh have low post-delivery complications (21%) as compared to pregnancy and delivery complication. The major problem during post delivery period is high fever (54.7%), lower abdominal pain (46.6%) and followed by excessive bleeding 21.8 percent (Table 3.12). Among the women who had post-delivery complications 66.6 percent had sought treatment (Table 3.15). In all the districts, women sought treatment for post delivery complication with highest in Shimla and Lahul & Spiti (100%) and in Chamba district none of the women sought treatment for post delivery complication.

## 7. CHILD HEALTH AND IMMUNIZATION

To promote child survival and prevent infant mortality, NHM/NRHM envisages new born care, breastfeeding initiation, infant food supplementation at the right time and a complete package of routine immunization for children. Sixty five percent of newborns were examined within 24 hours of birth (Table 4.1). In Himachal Pradesh, women who availed newborn care from Government health facility constitute 84.3 percent as compared to 15 percent from Private, at home (0.4%) and others (0.2 %). It is a substantial increased from DLHS-3 (75.2%). There is variation in rural areas in utilization of government health facilities (84%) and private health facilities (15.3%). Majority of women from Scheduled tribe and Scheduled caste communities check-up in government health facilities (94 and 91%) than in the private health facilities (12 and 21%).

Majority (90.6%) of children under 3 years of age,(born after January 1, 2008) were fed with colostrums and there is not much variation across selected background characteristics of women (Table 4.2). Highest proportion of children being fed with colostrums (96.7%) in Hamirpur district and the lowest in Bilaspur district (78.3%) (Table 4.5).

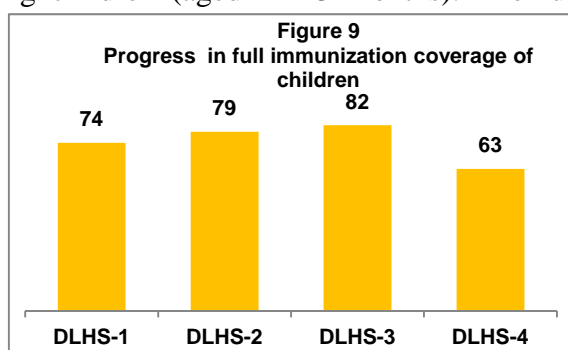

In Himachal Pradesh, 69 percent of women had initiated breastfeeding within one hour of the birth of the child. However, 90 percent of women in Himachal Pradesh initiated breastfeeding within 24 hours of birth of their children, ranging from 77.5 percent in Kinnaur district to 96.3 percent in Lahul & Spiti (Table 4.5). The proportion of women who initiated breastfeeding within one hour, within 24 hours and after 24 hours of birth are 68.7, 90 and 5.6 percent respectively.

Duration of exclusive breast feeding practiced is high (among infant under 2 to 5 months old) and is ranged from 66 to 56 percent. The introduction of food supplementation with semi-solid and solid food started between the age 4 to 5 months along with breastfeeding. As the age increases the percentage of the breast feeding declines and 17 percent of children under 18 to 23 months were breast fed along with other fluids, semi solid and solid foods (Table 4.3).

### 7.1 Immunization Coverage of Children (aged 12-23 Months)

The immunization coverage of children (aged 12-23 months) has been recorded either from vaccination card or by asking the mother in case the card was not available. Twenty one percent of children's immunization was recorded from the cards (Table 4.6). The full immunization coverage was 62.9 percent among children (aged 12-23 months). The full immunization comprises of BCG, three doses of DPT & Polio and measles (Table 4.6). In Himachal Pradesh, the coverage of BCG and measles are 94.9 percent and 87 percent respectively. Only less than one percent of children have not received any immunization.

The coverage of full immunization was 74 percent in from DLHS-1 to DLHS-2 (79%), to

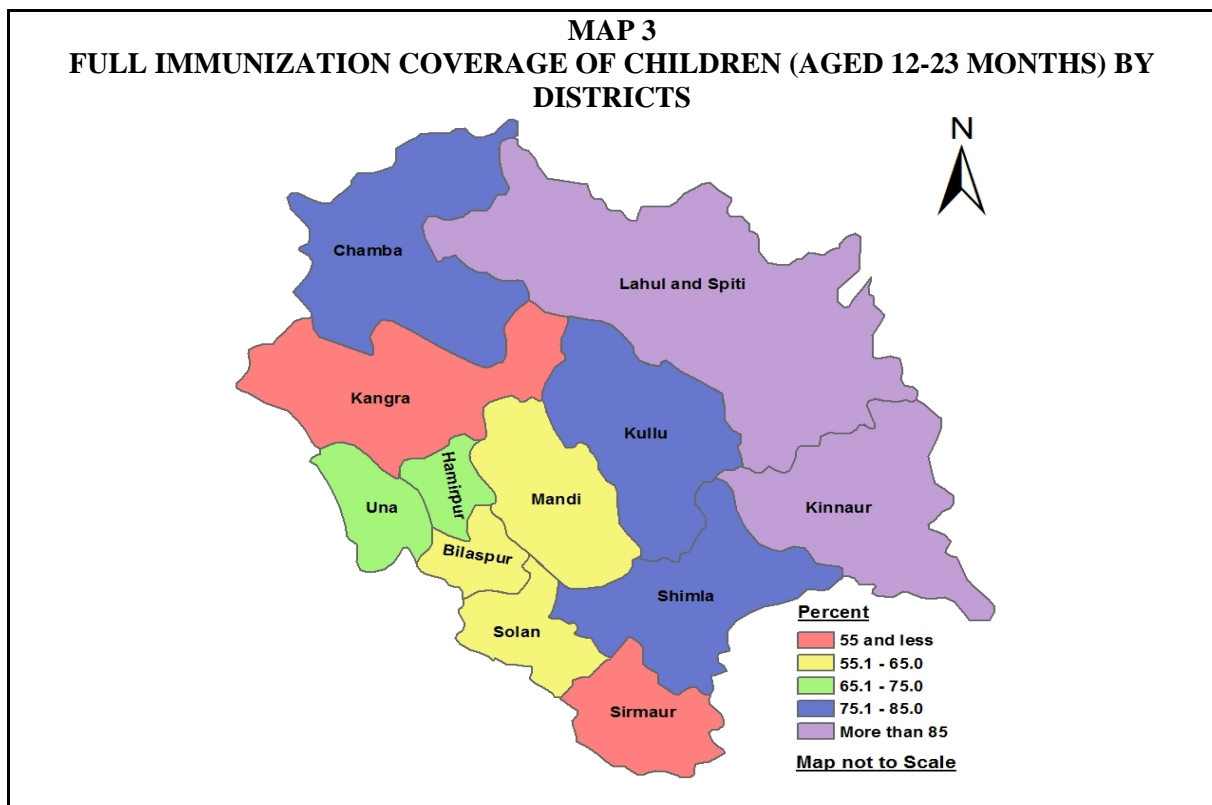

DLHS-3 (82%) and declined in DLHS-4 (63%) (Figure 9).

In the districts of Himachal Pradesh, the highest coverage of full immunization was in Shimla with 83.3 percent and lowest in Kangra with 40.4 percent. Out of 12 districts of Himachal Pradesh, 4 districts recorded full immunization coverage more than 70 percent whereas the remaining 8 districts had less than 70 percent coverage (Table 4.7). While the coverage of BCG is high in all the districts similarly for DPT-3 and Polio-3, except in Kangra district (58.5% & 64.4%). In case of measles the coverage fluctuates from 77 to 94.4 percent in the districts. The key to improvement in full immunization coverage is to monitor drop out at any stage of vaccination before completion of full course of immunization. Higher proportion of children (67.5%) of women educated up to 10 years and above received full immunization. Non-literate women's children received full immunization 50 percent (Table 4.6). In Himachal Pradesh full immunization coverage of children (aged 12-23 months) in urban areas (72.2%) is higher than in rural areas (62%).

With regard to the place of vaccination of children, it was reported that Sub-Health Centre (21.6%) and other government health facility (61%) (Table 4.8). District-wise variation in the coverage of full Immunization is depicted spatially in Map 3.

Children aged 9-35 months who received at least one dose of Vitamin-A is 87.5 percent in the State (Table 4.9). In Shimla district 95.3 percent of children received at least one dose of Vitamin-A, remaining all other districts where coverage of Vitamin-A is above 80 percent respectively.

Majority (88%) of children in Himachal Pradesh had received Hepatitis-B vaccination. There is marginal gap between children living in urban and rural areas.

## 7.2 Management of Diarrhoea and Acute Respiratory Infection (ARI)

The information on knowledge of diarrhoea and ARI management was collected from women respondents as part of assessment of child care knowledge. Majority (94.8%) of women have knowledge of diarrhoea management (Table 4.10) and more than 85.4 percent of the women are aware of danger signs of ARI (Table 4.12).

The common practice followed by women for treatment of children who had diarrhoea was to give ORS (83.2%), salt and sugar solution (69.4%), plenty of fluids (28.7%), continue normal food (23.7%) and continue breastfeeding (23.2%) (Table 4.10). In Himachal Pradesh, 75.3 percent children given ORS who suffered from diarrhoea, while 67.5 percent of them were given some treatment or the other (Table 4.11). Majority (82.6%) of children who had suffered from diarrhoea are treated in a government health facility and 14.8 percent in a private health facility (Table 4.11).

In Himachal Pradesh, 85.4 percent of women are aware of danger signs of ARI. Among them, 47.4 percent of women knew that difficulty in breathing, 45.1 percent knew pain in chest and productive cough, 32.8 percent knew wheezing/whistling, 27.8 percent consider rapid breathing and 43.5 percent having knowledge of others signs of ARI (Table 4.12).

Five percent children had suffered from ARI in the last two weeks prior to the survey. Out of total children suffered from ARI, 93.2 percent had sought advice/treatment. Majority (67.6%) of children had treatment at government health facility and only 31.1 percent (Table 4.12) went to private health facility.

The prevalence of ARI among children varies from 0.9 percent in Mandi district to 7.7 percent in Una district. The treatment seeking for ARI or fever is 100 percent and more in the districts of Mandi, Kangra, Hamirpur, Bilaspur, Shimla and Srimaur (Table 4.13).

## 8. FAMILY PLANNING AND CONTRACEPTIVE USE

Family planning program in India has undergone sea changes in terms of strategies, focus and objectives. Post ICPD 1996 program oriented has evolved itself in to a human right framework keeping in mind the central point to reduce unmet need for family planning. Strategies under NRHM were to create demand for family planning through enhancing child survival and improving maternal health.

There is awareness to the extent of 78 percent about female sterilization but male sterilization and Condom/Nirodh is known to only 46 and 41 percent of women respectively. Nearly 27 percent of the women know about IUD, but knowledge of Condom/Nirodh is as high as 41 percent. The knowledge of traditional method is only 12 percent among women in Himachal Pradesh. However new methods on menu of Indian program/or in market like female condom is known only 5 percent among women. Female sterilization is the predominant limiting method being used by 42 percent of currently married women in 15-49 years and popular male oriented spacing or temporary method is Condom/Nirodh having being used by 16 percent of husbands of currently married women. IUD and Oral pills are being ever used by 1.6 and 5.7 percents of women respectively. Among the currently married women the proportion ever using any modern method is 62.4 percent, while 64.4 percent of women ever used either modern or traditional methods. There is no substantial rural-urban difference in the ever use of any modern contraceptive use. However, female sterilization among rural women is 42 percent which comparatively more than among urban women with corresponding figures is 37 percent.

The status of current contraceptive use among currently married women or their husband shows that 58 percent of them were using one or other modern method mostly female sterilization (42%) at the time of survey. Condom/Nirodh is in use by 10 percent of currently married women's husbands same as in DLHS-3. The female sterilizations are more among rural women (42%) and non-literate (50%) women compared to that among urban women (38%) and women educated for at least 10 years (33%).

Female sterilization regardless of family size is more among currently married women who have one or more living sons compared to those with no living son. Nearly 10 percent of women in 25-29 years and about 40 percent of women in 30-34 years have been found to have undergone female sterilization at the time of survey. The mean age at the time sterilization is 31 years. Among the currently married women, proportion continuing IUD use for less than 2, 2-3 and more than 3 years are respectively 11, 6 and 54.6 percents respectively. Oral pill users continuing for more than 6 months constitute 69 percent of the total pill users and 64 percent of condom users are continuing for longer than 6 months. It must be noted that the use of traditional methods has declined in Himachal Pradesh probably being replaced by more effective method of contraception.

Contraceptive prevalence rate (CPR) for any modern method is below 70 percent in all the districts of Himachal Pradesh. Highest CPR for any modern method is 68.4 percent in Hamirpur district and lowest is 43.3 percent in Kinnaur district. The prevalence of female sterilization in half of the total number of districts are above the state average of 42 percent. The contrast in the source of terminal and temporary methods of contraceptive is that 95 percent of sterilization has been done in government health facility and 46 percent have

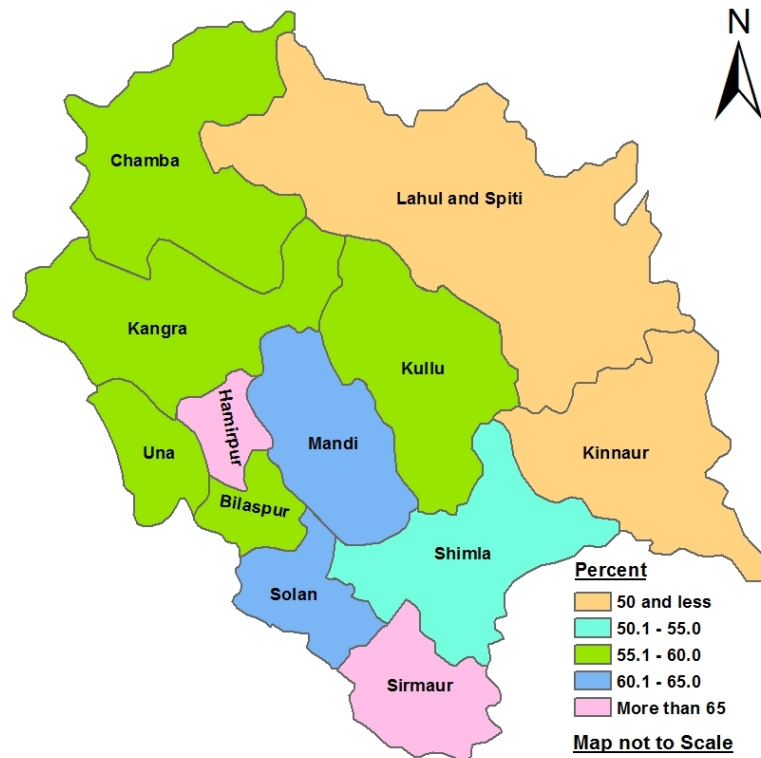

availed government health facility service for spacing methods. The high and low utilization rate of government health facility for limiting and spacing methods is true for all the districts of Himachal Pradesh. Nearly 64 percent of sterilized women and wives of sterilized men got monetary compensation for sterilization, with variation of 50 percent in Kinnaur and 75 percent in Chamba district. As many as in 72 percent of sterilization cases monetary compensation is given at the time of discharge.

Nearly 17 percent of sterilized women, 25 percent IUD and 28 percent Pills users were informed about the side effects before the adoption and 4, 4 and 3 percents of women using the aforesaid methods have experienced side effect or health problem. Among the currently married women who have discontinued contraception the main reason cited is related to other method (45%) while 30 percent mentioned fertility related problems and 25 percent mentioned side effects. For the younger women in 15-29 years reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no or one living children.

About 5 percent of currently married women aged 15-49 years, not using any contraception intend to adopt limiting method and 4 percent spacing method in future. Those who intend to adopt either limiting or spacing methods in future within 12 months, after 12 months and still undecided about the timing constitute 24, 30 and 46 percents respectively.

Unmet need for spacing includes the proportion of currently married women who are neither in menopause nor had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing. In Himachal Pradesh 11 percent of currently married women have unmet need for spacing. Unmet need for spacing is 24 percent for women with one living child and 42, 32, 22 percents for women aged 15-19, 20-24 and 25-29. On the other hand, currently married women who are still have physiologically potential for conceiving and want no more children are categorized as having unmet need for limiting. The unmet need of contraceptive for limiting is about 9.7 percent in the state.

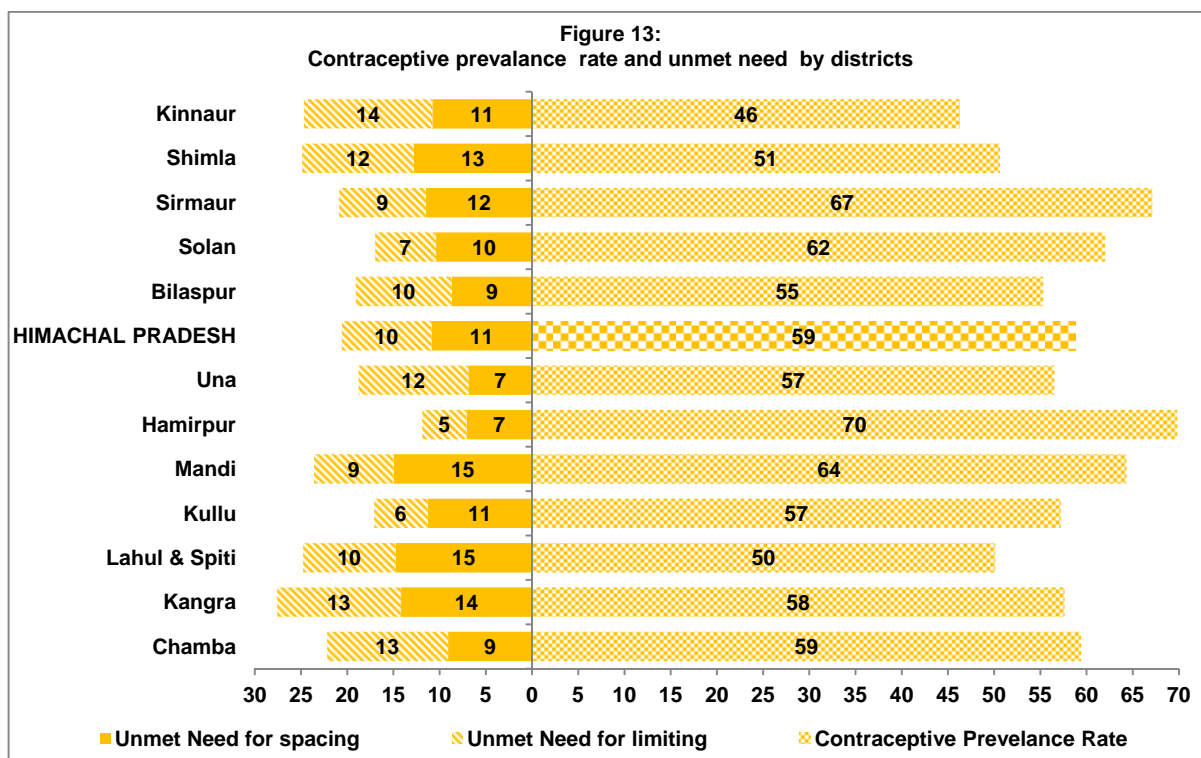

**MAP 4  
CONTRACEPTIVE PREVALENCE RATE FOR ANY METHOD BY DISTRICTS**

Currently married women with unmet need for spacing is highest in Lahul & Spiti district (15%) and lowest is in Una district (7%). On the other hand unmet need for limiting is also highest in Kinnaur (14%) and lowest is in Hamirpur (4.8%)

The total unmet need of contraceptive has been increased in DLHS-2 to DLHS-3. It was 10 percent in 2002-04, 14 percent in 2007-08. In 2012-13 it seems unmet need has marginally increased to 21 percent. This is basically due to higher unmet need for spacing among the younger cohort, a sign of decline in the desire for large family size. District wise contraceptive prevalence rate and unmet need are presented in figure 13.

## 9. REPRODUCTIVE HEALTH

Reproductive health addresses the issues of reproductive processes, encompassing the functions and system at all stages of life. The reproductive health, is the ability for the people to have a responsible, satisfying and safe sex life and have the capability to reproduce and the freedom to decide if, when and how often to do so. This means that the right of men and women alike to be informed of and to have access to safe, effective, affordable and acceptable methods of fertility regulation of their choice, and the right of access to appropriate health care services that will enable women to go safely through pregnancy and childbirth and provide couples with the best chance of having a healthy infant. The burden of diseases among women is due to reproductive function and system. The five main causes of the disease burden among women in developing countries are maternal, Sexually transmitted disease, tuberculosis, HIV infection, Depressive disorders. DLHS-4 has obtained information on awareness and prevalence of RTI/STI, HIV/AIDS, information and ways to avoid AIDS.

### 9.1 Menstruation Related Problems

The women reported to have menstruation related problems and have specific symptoms during three months preceding the survey by background characteristics is given in Table 6.1. Menstrual problems are experienced by 8 percent of women in Himachal Pradesh. The problems of painful periods (54%) and irregular period (39%) are the main menstrual problems experienced by women. The other problems reported are frequent or short periods (12%), prolonged (15%) and scanty bleeding (11%), absences of periods and blood clots/excessive bleeding (5%). The differentials in menstruation related problems are found by age, place of residences and education of both husband and the women. Women who had consummated their marriage below 18 years of age have had more menstruation related problems (9%). The menstrual related problems also increased with duration of marriage.

More than 8 percent of women had reported to have menstrual problems whose marital duration was 10-14 years and was more than 15 years. The menstrual related problems did not differ by caste and religion.

## **9.2 Awareness of RTI/STI**

The awareness of RTI/STI was obtained from ever married women. The women who are aware about RTI/STI were further asked on the modes of transmission and symptoms of the disease. Table 6.2 shows the percentage of women who have heard of RTI/STI by background characteristics. More than one-fourth of women in Himachal Pradesh had heard of RTI/STI. The proportion of women who were aware of RTI/STI was comparatively higher in urban areas (36%) than in rural areas (29%). Awareness of RTI/STI was lower among young women, women with low age at consummation of marriage, non-literate and women from Other Backward Castes and Muslim Women. Awareness of RTI/STI increases with education of women. Thirty nine percent of women who had completed ten or more years of schooling were aware about RTI/STI.

Television is an important source of knowledge about RTI/STI, more than 90 percent women reported they had heard about RTI/STI from TV. Another major important sources of information about RTI/STI are from print media (54%), cinema (41%), community leaders' meeting (33%). The sources of knowledge about RTI/STI differ by education of women and husband.

## **9.3 Knowledge Regarding Mode of Transmission of RTI/STI**

The knowledge regarding mode of transmission of RTI/STI was asked to women who had heard of RTI/STI (Table 6.3). Almost more than fifty percent of women reported unsafe delivery, unsafe abortion and unsafe sex with persons who have many partners as a mode of transmission of RTI/STI. Around 38 percent women reported unsafe sex with sex workers as a mode of transmission of RTI/STI. More than one third women reported unsafe IUD insertion and unsafe sex with homosexuals were also reported by women as mode of the transmission of RTI/STI. The knowledge varies by residence, age at consummation, education of women and education of the husband.

Table 6.4 shows the common symptoms of reproductive tract infections/sexually transmitted infections among women. About 14 percent of ever married women have reported having symptoms related RTIs/STIs and 6 percent experienced abnormal vaginal discharge. The women reported itching or irritation over vulva (4%), pain in lower abdomen not related to menses (5%). About 58 percent of women discussed the RTI/STI related problems with their husband or partner (Table 6.5). The women mostly sought treatment for RTI/STI (73%) from government health facility.

The women who have heard about RTI/STI varies from 17 percent in Solan district to 63 percent in Lahul & Spiti district. Women reporting any abnormal vaginal discharge varied from 2.2 percent in Shimla district to 10.1 percent in Kullu district. More than half of the women in three districts (Kullu, Solan and Kinnaur) except all other district had Sought treatment for any RTI/STI including abnormal discharge.

## 9.4 Awareness of HIV/AIDS

The awareness on HIV/AIDS was asked to ever-married women age 15-49 years. Nearly two third of the women had heard about HIV/AIDS. Television is the one of the major source of knowledge on HIV/AIDS. Ninety two percent of women reported that TV is the main source of knowledge on HIV/AIDS, cinema (46%), followed by Community's leaders meetings (39%), print media (48%), school adult education programs (35%), health personal (34%), husband (10%) and radio (23%) (Table 6.7). More than (65%) percent of the women reported unsafe sex with person having many partners, transfusion of infected blood (52%), infected mother to child (52%) and sharing of injection/needle as mode of transmission of HIV/AIDS (46%) (Table 6.8). The reported modes of transmission of HIV/AIDS differ by residence, education of women and husband.

Table 6.9 shows knowledge of methods of preventing HIV. About two third percent of women were of the view that HIV/AIDS can be prevented by avoiding risks of getting infected through blood. More than one-third of women were of the opinion that by using condom correctly during each sexual intercourse and having sex with one uninfected partner can prevent HIV/AIDS. The differences in the preventing HIV/AIDSs were found by residence, age at consummation of marriage, education of women and husband. The misconception about transmission of HIV/AIDS from mosquito, flea or bedbug was reported by 4 percent of women. The other misconception was sharing food (1.5%), stepping on someone's urine/stool (2%), sharing clothes (1%), hugging (1%) and shaking hand (1.5%) respectively.

The women who had heard about HIV/AIDS were asked the place to test the HIV/AIDS (Table 6.11). More than half of the women know the place where the HIV/AIDS could be tested. The differences in the place of test were found by residence, age at consummation of marriage, education of women and husband. Forty seven percent of women reported government hospital/dispensary and 12 percent reported private hospital/clinic as a place where people can go to test HIV/AIDS. The women who have heard about HIV/AIDS were asked if they had gone for the test. Thirty six percent of women had undergone for the test of HIV/AIDS. The women who had undergone a test 18 percent had undergone test before a year (Table 6.12). Comparison with district figures Lahul & Spiti highest (54%) and Mandi (20%) has lowest number of women has been tested for HIV/AIDS.

## 10. PERSONAL HABITS

Personal habits of adults (age 15 and above) such as consumption or abuse of tobacco and alcohol, and eating unhealthy foods are usually viewed from the lens of risk-taking behaviour due to their adverse health outcomes. The emerging morbidity pattern from the personal habits is a crucial predictor of current as well as future health status of a population. It has become increasingly important to understand and examine the impact, these habits have on overall health status in India in the context of the epidemiologic and demographic transitions. Besides, the treatment seeking behaviours for these illnesses reflects the availability, accessibility, as well as quality of health care services. Studies have shown evidences of correlation between the shift towards non-communicable diseases (NCD) and increasing risk-

taking behaviours among adult individuals. For instance, excessive drinking is linked to acute and chronic physical health problems, particularly those related to the heart, blood circulation, respiratory, diabetes, mental health, cancer, crime and disorder, domestic violence, unprotected sex, unintended pregnancy, etc., (Room, Baboor, and Rehm, (2005). Alcohol consumption contributes to many diseases and is now the fifth leading risk-factor for the global disease (Lim, Vos, Flaxman, et al, 2012). Also, the economic burden of these NCD is equally serious - i.e., a 10 percent rise in NCDs is found associated with 1 percent lower rates of annual economic growth. However, programmes to combat NCDs were tremendously underfunded, and a low priority policy, as it is not part of the millennium development goals (MDG).

The WHO has recently stated that NCD such as cancer, diabetes, and hypertension are largest causes of death, and by 2020 cardiovascular diseases will be the largest cause of death and disability, including developing countries like India (WHO 2010). In 2012, the UN conference on sustainable development (Rio+20), referred to non-communicable diseases as “one of the major challenges for sustainable development in the 21<sup>st</sup> century”, emphasising the fundamental link between health and development. In the same year, the World Health Assembly endorsed an important new health goal: to reduce avoidable mortality from non-communicable diseases (NCDs) by 25% by 2025 (the 25 by 25 goal). The future threat to health is from NCDs, as the world also urbanizes faster than before.

Since 1990s India’s overall health status has shown tremendous improvement, which signals a change and shift in pattern of morbidity and causes of death to non-communicable diseases (NCD), despite still substantial contribution of communicable diseases. The NCD accounted for 42 percent of all deaths in India (56% in urban areas and 40% in rural areas), as compared to communicable diseases with 38 percent (RGI, 2003). Estimated prevalence of diabetes, hypertension, ischemic heart diseases (IHD) and stroke is 62.5, 159.5, 37.0 and 1.54 per 1000 respectively. In the National Health Policy (NHP), the Government of India (GOI) has committed to eradicating infectious illnesses and reducing the mortality associated with such illness (MOHFW, 2002). One of the goals of the NHP 2002 is a 50 percent reduction of deaths from TB, malaria, and other vector and water borne diseases by the year 2010.

This chapter presents findings on the personal risk-taking habits, acute and chronic (infectious and non-communicable) diseases, and their treatment-seeking behaviours.

### **10.1 Tobacco and Alcohol Use in India**

Tobacco and alcohol use have been associated with a wide range of major diseases, including several types of cancers and heart and lung diseases. Studies have shown that in addition to sharing the same health risks as men, women who use tobacco or alcohol also experience difficulty in becoming pregnant, are at an increased risk of infertility, pregnancy complications, premature births, low-birth-weight infants, stillbirths, and infant deaths (USDHHS, 2004).

In India, information about tobacco and alcohol use among adults has been collected by various household surveys such as the National Sample Survey (NSSO) (50th round, 1998), NFHS (1992-93, 1998-99, and 2005-06), DLHS (2007-08), the Global Adult Tobacco

Survey-India (GATS-India, 2009-10), etc., each survey with specific objectives and methodology. According to GATS India, 35 percent of adults in India age 15 and over use tobacco in some form or the other, with higher use among adults in most North eastern region (39-67%), east (36-50%), and central (40-53%) (IIPS & MoH&FW, 2010).

In India, there are varieties of tobacco products and its use is also very diverse. The most common ways of tobacco use are the smoking and oral (smokeless) variety. Dominant among the smoking form include cigarettes and bidis, while in case of the oral use of smokeless tobacco, chewing or applying to the teeth or gums (scented/unscented, with paan) are the popular forms, which has also become very popular in most parts of the country. The DLHS-4 also collects information related to tobacco and alcohol usage directly from among the eligible adults (women age 15-49 and men age 15-54).

In case of alcohol consumption, household surveys in India show that alcohol use among adults, both men and women, is not uncommon, but the use is found much lesser than tobacco use. Alcohol consumption is higher among men than females. Study in India indicated the prevalence of current use of alcohol ranged from about 7 percent in Gujarat (state officially under prohibition) to a very high 75 percent in Arunachal Pradesh, and its consumption among women exceeded 5 percent only in the Northeastern region. DLHS-4 information on alcohol use by adult men and women comes from a substantial number of respondents (9,935 men and 13,013 women).

## **10.2 Tobacco Use in Himachal Pradesh**

As shown in Table 7.1, overall 18 percent of adults in Himachal Pradesh use any kind of tobacco in one way or the other. However, tobacco use varies across the state by age, residence, education, region, etc. The survey clearly indicates that tobacco use is highest and more likely among men (36%), people with less than 5 years of education (20%), rural residents (18%), and among schedule tribe (20%), etc.

In Himachal Pradesh, among adults, smoking is more prevalent (17%) as compared to the oral form (smokeless variety) of tobacco (4%). Use of smoke tobacco is higher among men (34%) as compared with females (2%) and also more likely to be higher among the older adults age 40 and above (over 20%), and among schedule tribe (19%).

In general, it is observed that in Himachal Pradesh use of tobacco among adults increases with age. The pattern of using tobacco among adults also shows an interesting scenario across the districts in Himachal Pradesh. Of the 12 districts in the state, two districts, namely Chamba and Shimla stand out as lower use of tobacco in the state (Table 7.4). Reporting of use of oral or smokeless form is highest in Kullu (12%), followed by Bilaspur (6%) & Srimaur (5%). In most of the districts, the proportion of adults using oral form of tobacco is around 0.9 to 12 percent. In case of smoking form of tobacco the use among adults ranges from 13 percent in Bilaspur to 26 percent in Kullu. Other districts in which around 14 to 19 percent of adults are likely to smoke.

The use of tobacco (all forms) among men is on the lower side in Himachal Pradesh – 8% for oral or smokeless and 34% for smoking. It is interesting to note that both forms of tobacco

use is the lowest among teenagers (less than 1%), but increases from age 20 onwards (among the youth) to older ages. Smokeless tobacco use is slightly higher among men in rural areas (9%) than urban males (8%). Interestingly, smoking in men shows a same scenario in Himachal Pradesh. Smoking is found to be higher among men in rural areas (35%) than in urban areas (27%). Among men also, age and education emerge as important factors. The older males say age 30 and above (8-11%) are much more likely to use tobacco products than those aged less than 20 (below 1%). Similarly, as education level increases use of tobacco in any form is more likely to diminish among men. The more educated males are less likely to use tobacco than their counterparts who are illiterate (Table 7.2).

In Himachal Pradesh, strictly speaking, both forms of tobacco are widely used by men (8-34%). About one percent of adult men use tobacco with paan, and below one percent with guthka/paan masala. Use of paan with tobacco among men is slightly higher in rural areas, while use of guthka/paan masala with tobacco is higher in urban areas (Table 7.5). In the case of smokers, more of rural men use this form (35%), higher by about 8 percent, than those in urban areas (27%). About 15 percent of men are usual smokers (smoke at least once a day) in Himachal Pradesh. The proportion of usual smokers is 16 percent in rural areas as compared with 10 percent in urban areas (Table 7.6).

Generally, use of tobacco is found to be very less among women, more so when compared with men. In Himachal Pradesh (Table 7.1), a small proportion of adult women reported using any kind of tobacco (2%). Among the women tobacco users, while only about 2 percent smoke, a very small proportion of them (about 1%) use the oral form or chew tobacco (Table 7.3).

The pattern of tobacco use observed among women is found to be very interesting. For instance, it shows a constant pattern (below 1%) over different ages for both type of tobacco for women in Himachal Pradesh. Only about 2 percent of women in rural areas smoke, compared with about below 1 percent in urban areas. Among those women who use non-smoke form/chew tobacco, about 0.1 percent used it with betel nut or paan (Table 7.5). Among women who smoke, just about 0.7 percent are usual smokers (smoke at least once a day) (Table 7.6).

### **10.3 Use of Alcohol in Himachal Pradesh**

Household surveys in India show that alcohol use among adults, both men and women, is not uncommon, but the use is found much lesser than tobacco use. Alcohol consumption is higher among men than women. Study in India indicated the prevalence of current use of alcohol ranged from about 7 percent in Gujarat (state officially under prohibition) to a very high 75 percent in Arunachal Pradesh, and its consumption among women exceeded 5 percent only in the Northeastern region. DLHS-4 information on alcohol use by adult men and women comes from a substantial number of respondents (9,935 men and 13,013 women).

As presented in Table 7.1, in Himachal Pradesh 18 percent of adults consume alcohol. In the state, the level of consumption is found much higher among adults age above 30 (19-26%) and highest among scheduled tribe (22%). Like use of tobacco, education does not make much impact as an important factor. Highest alcohol consumption is observed for people with

more years education (19-20%). The level of alcohol consumption by religious affiliation shows that the least consumption is among Muslims (15%) and highest among Others (25%).

In Himachal Pradesh, alcohol consumption across the districts shows that of the 12 districts, only in 4 districts the level is less than 15 percent (Table 7.4). The prevalence of alcohol use across the state ranges from 12 percent in Bilaspur to about 25 percent in Lahul & Spiti. Consumption of alcohol is found high in districts such as Kullu (25%), Mandi (21%), and Shimla (20%). Districts with 19 percent of adults consuming alcohol are Kinnaur, Srimaur and Kangra.

In Himachal Pradesh, consumption of alcohol is found more concentrated among males (37%) as compared with (2%) among females (Table 7.1). Men who are more likely to consume alcohol are those in their 30's and 40's (above 40%), non-literates and less than 5 years of education (44-46%), for other religions (above 47%) and other backward classes (40%). The reporting of consumption of alcohol is seen among the teenagers (2%). Alcohol consumption among men is higher in rural areas (38%) as compared with urban areas (30%).

Only about 2 percent of adult females reported consuming alcohol in Himachal Pradesh (Table 7.3). The consumption of alcohol increases by age, with higher intake among older females age 35 and above (about 1-3%). Women who reported consumption of alcohol are non-literate (about 3%). A very small proportion (0.5%) of females in Himachal Pradesh reported as being a usual drinker.

## **11. MORBIDITY STATUS**

In DLHS-4, for the first time, information on morbidity status of the household members was collected from the household respondent. The main objective is to get a somewhat fair idea about the prevalence of both acute illnesses (suffered for a week) and chronic illnesses (for a month or more), including disability (current) and injury (in last one year), suffered by any household member prior to the survey. Respondents were asked about occurrences of such illnesses among the household members, and to name the illness, including those diagnosed. Further, in case of occurrence of any disability, injury or illness, respondents were also asked about the nature of care sought, the type and place of health facility where treatment was done.

Depending on the nature and duration, all the illnesses or diseases are classified as (a) acute, and (b) chronic. Acute illness refers to those that occur suddenly with severe symptoms for short period during the last 15 days prior to the survey. Example includes diarrhoea, dysentery, acute respiratory tract infection (ARI), jaundice with fever, fever with chill/rigors/malaria, fever with rash, reproductive tract infections (RTI), etc. In case of chronic illness, those symptoms that persist for longer than one month in the past one year prior to the survey. The list provided includes both symptoms and associated diseases categories.

### **11.1 Disability and Injury**

From each of the selected household, DLHS-4 collected information from the head of the household or adult respondent on any injury and on five specific disabilities that household

members may have suffered from such as mental, visual, hearing, speech, and locomotor. As it is difficult to capture the type of injury and its severity from lay reporting, assessment is made indirectly from the type and duration of hospitalization required for the injury.

As presented in Table 7.8, in Himachal Pradesh about 4 percent of the sample population reported suffering from any injury. The prevalence of any injury is a little higher in the rural areas (4.1%) compared to urban areas (3.7%). The prevalence of any injury shows not much variation between males and females in the state.

About 10 percent of the injuries reported were treated in intensive care. However, 15 percent of injuries were treated as in-patient with stay for less than a week, and 14 percent reported they treated as in-patient with stay for more than 2 weeks. Interestingly, in Himachal Pradesh, about 47 percent of injuries were treated using other form of treatments, i.e. other than intensive care or staying/in-patient, such as out-patient, traditional healers, or home remedies. More of females go for treatments for 1-2 week stay in-patient(15%) as compared with males (13%), while men are more likely to be treated in intensive care or as in-patient with stay more than 2 week. There is variation in terms of treatment of any injury by residence in Himachal Pradesh.

In Himachal Pradesh, among the five disabilities, the prevalence of hearing visual disability is a little higher (1%) as compared to other disabilities. Reporting of visual disability is equal for female and male (0.8%). Mental and hearing disabilities are the other two disabilities reported in Himachal Pradesh (0.2% and 0.2% respectively). The prevalence of visual disabilities is higher in urban area than rural area (Table 7.9).

## **11.2 Reported Illnesses: Acute and Chronic**

In order to assess the prevalence of illnesses from the selected household level in DLHS-4, the household respondents were first asked if any member of their households had suffered from any illness in the past one month or year. If reported that someone had suffered, more detail of the illness recorded, including main source of treatment. As mentioned earlier, all the illnesses are classified into (a) acute and (b) chronic, based on the nature and duration, and the information is collected from head or any adult member of the household.

### **Acute Illnesses**

The prevalence of acute illness at the household level in Himachal Pradesh is 2 percent. The differential in the prevalence of acute illness by residence shows not much variation (around 2.3% in rural & 1.5% in urban).

About 2 percent of household members reported suffering from any acute illness in Himachal Pradesh, and equal proportion of men and women (2.2%) reported to have suffered from any acute illness. Among the prevailing acute illnesses, fever (other than those with rash or jaundice) is reported by nearly 22 percent, followed by acute respiratory tract infection (ARTI) (7%), malaria (10%), fever with rash (11%), diarrhea/dysentery (19%), and Jaundice with fever (15%). Acute respiratory tract infection (ARTI) and diarrhea/dysentery are found to be higher in rural areas than in urban areas. The prevalence of other acute illnesses is observed to be around 15%. Interestingly, for most of the acute illnesses reported, more men

suffered from most acute illnesses than women. Prevalence of acute illnesses is also found higher in rural areas, barring ARI and fever (other type of fever).

Nearly everyone who had suffered from any acute illness sought treatment. Among those who had sought treatment, 79 percent preferred treatment at government facility, mainly in Hospitals (33%). About 12% of those who had acute illnesses got treated in a private facility, mainly in a hospital, followed by Dispensary/clinic (5%). About 1 percent with any acute illnesses were treated at DOTS centre or at home. In Himachal Pradesh, use of government health facility for treatment of acute illness is quite common even in rural areas (79%), and equally accessed by both males and females.

### **Chronic Illnesses**

Survey results of chronic illnesses described pertain to prevalence, type, and source of treatment by sex and residence. In Himachal Pradesh about 3 percent of the households reported a member suffering from chronic illnesses that lasted for over a month in the past one year prior to the survey (Table 7.8). As shown in Table 7.13, reporting by symptoms of chronic illnesses suffered by household members is highest for diseases of the respiratory system (11%), followed by diseases of central nervous system (10%), musculoskeletal system (8%), followed by diseases of skin and eye (7%). Diseases related to respiratory system, musculoskeletal system and central nervous system account for about 8-11 percent respectively. Interestingly, reporting of symptoms of chronic diseases other than the twelve identified diseases account for 33 percent.

In Himachal Pradesh, not much differences observed in the reporting of symptoms of chronic diseases between males and females, except in case of some diseases. For instance, more males reported symptoms related to respiratory system (13% as compared with 9% among females), cardiovascular system (7% against 5% among females), and for central nervous system (13% against 8% among females). In contrast, females reported more of symptoms related to disease of musculoskeletal system (10% compared to 6% among males).

By and large, most chronic illnesses show more or less similar prevalence in both rural and urban areas. However, some of these chronic illnesses show slightly higher prevalence either in rural or urban areas. For instance, urban residents reported more of diseases of central nervous system (19%), genitourinary system (6%), eye problem (10%) and skin diseases (8%) than rural residents. In case of rural areas, much higher reporting related to diseases of respiratory system (11%), cardiovascular system (6%) musculoskeletal system (8%) and 'other' (34%).

Household respondents were also asked about the nature and source of treatment for chronic illnesses suffered by any of their household member. In Himachal Pradesh, 75 percent of those who suffered from chronic illnesses have details of diagnosis or treatment. About (13%) has no details of diagnosis or treatment, and about 13 percent do not sought treatment at all. The proportion with no details of treatment (13%) is more in the rural areas as compared to urban areas (3% respectively). Overall, 74 percent of rural residents and 84 percent of urban residents have details of diagnosis or treatment for the chronic illnesses. It is

also observed that both males and females have more or less equal accessibility to health care services for chronic diseases (Table 7.13).

Interestingly, in Himachal Pradesh most people who suffered from chronic illnesses sought treatment at government facility (72%), even among rural residents (73%), and the proportion is 66 percent among urban residents. About 27 percent were treated at private facility (26% in rural areas and 34% in urban areas), while 1 percent reported being treated at home, and about 1 percent sought other form of treatment.

Persons who sought treatment for chronic illnesses were also asked about the details of the diagnoses at the facility. In Himachal Pradesh, hypertension (18%) and diabetes (14%) are the most commonly diagnosed chronic illnesses, followed by diseases related to heart (8%) and asthma or chronic respiratory failure (6%). Goitre accounts for about 2 percent of the diagnosed chronic illnesses, and about 1 percent with tuberculosis (TB). As expected, the proportion diagnosed with these chronic illnesses is much higher in urban areas, particularly hypertension and diabetes. The results show that more males suffered from heart diseases (10% against 6% among females) and asthma and chronic respiratory failure (9% against 3% among female) (Table 7.14).

Contrast to situation in the general population, among the older persons age 60 and above the prevalence of most chronic illnesses is much higher. For instance, about 15 percent of older persons were diagnosed with diabetes and 11 percent with asthma and chronic respiratory failure (Table 7.15). The prevalence of some of these chronic illnesses indicates that higher proportion of older persons in urban areas suffered from hypertension (18% as compared with 17% in rural areas) and diabetes (29% against 14% in rural areas). Similar to the situation in the general population, among the older persons also it is found that more females are diagnosed with hypertension (18% as compared with 17% among males) and diabetes (19% as compared with 11% among males). More of male older persons are diagnosed with diseases related to heart, asthma or chronic respiratory failure and TB, which is found to be similar in both urban and rural areas.

### **11.3 Tuberculosis (TB)**

Tuberculosis has re-emerged as a major public health problem in many parts of the world, often as a concomitant illness to HIV/AIDS. Tuberculosis, once known as the 'White Plague', is contagious and spreads through droplets that can travel through the air when a person with the infection coughs, talks, or sneezes. Today, TB is a leading cause of death among people who are HIV-positive. Worldwide, an estimated one-third of the nearly 40 million people living with HIV/AIDS are co-infected with TB. In most developing countries, TB would continue to be a serious health threat even in the absence of HIV/AIDS due to the public health challenges posed by poverty, high illiteracy, and poor sanitation. The GOI has stated that 'In 2005, a total of 97 percent population was covered under the Revised National Tuberculosis Programme.' The government allocated Rs. 680 crores for the National Tuberculosis Control Programme (NTCP) in the 10th Plan (DGHS and WHO, 2005).

In Himachal Pradesh, about 1 percent of the household population diagnosed with TB, which is found to be higher in urban areas.

## 12. NUTRITION AND HEALTH

The DLHS-4 collected data on the nutritional status of children by measuring the height and weight of all children under age five in the selected households. The nutritional status assessment helps to identify sub groups of child population that face increase risk of faltered growth and potential health risks and vulnerabilities. The nutritional status of children in the survey population is compared with WHO child growth standards , which are based on an international sample of ethnically, culturally and genetically diverse healthy children living under optimum condition that are conducive to achieving a Child's full genetic growth potential (WHO, 2006)<sup>1</sup>. These standards can therefore be used to assess nutritional status of children all over the world, regardless of ethnicity, social and economic influence and child feeding practices. Accordingly, three standard indices of physical growth that describes the nutritional status of children are height-for-age (stunting), weight-for-height (wasting) and weight-for-age (underweight). Each of these indices provides different information about growth and body composition that can be used to assess nutritional status.

In DLHS-4, all children listed in the household, who were born in year 2008 or later were eligible for measurement of their height and weight. Thus, height and weight measurements were collected even from those children whose mothers may not have been interviewed in the survey. For this purpose, all the survey team carried with them two scales and two height boards, which were standardized in all aspects and calibrated for accuracy. Recumbent length was recorded for children under age two years. Standing height was measured for all other children. Table 8.1 represents percentage of children below age five classified as malnourished according to three anthropometric indices of nutritional status (height for age, weight for height and weight for age) by some selected background characteristics. The analysis is based on information collected from 1957 children from Himachal Pradesh for whom complete and erodible anthropometric and age data are available.

### 12.1 Height-for-Age (Stunting)

Height-for-age measures linear growth. A child who is more than two standard deviations below the median (-2SD) of the WHO reference population in terms of height-for-age is considered short for his or her age are stunted. This condition reflects the cumulative effect of chronic malnutrition. If a child is below three standard deviations (-3SD) from the reference median, he or she is considered to be severely stunted. In Himachal Pradesh 33 percent children under age five are stunted and 18 percent are severely stunted. Variation in the prevalence of stunting by age group shows that stunting is highest (55%) in children age 19-24 months, followed by those in age 36 months and above(37%) and the lowest (12%) in children below age 6 months. Prevalence of sever stunting shows a similar pattern, with the height proportion of sever stunting in children age 19-24 months (39%), followed by among those age 25-35 months (23%). Sex differential in the prevalence of stunting is not much pronounced as male children are relatively more likely to be stunted (34%) than female

---

<sup>1</sup> World Health Organization (WHO) Multicentre Growth Reference Study Group. 2006. *WHO Child Growth Standards: Length/Height-for-Age, Weight-for-Length, Weight-for-Height and Body Mass Index-for-Age: Methods and Development*. Geneva, Switzerland: WHO.

children (32%). The sex differential remains by and large the same even in case of severe stunting. There is difference in children under age five belonging to Muslim family and other backward castes family are more to be stunted than all 'others'.

The prevalence of stunting is not uniform across different districts in Himachal Pradesh. Stunting is the lowest in Una district (19%) and followed by Kinnaur (25%). While, the prevalence of stunting is the highest in Chamba (48%) followed by Mandi and Solan (46% and 45% each). Severe stunting is the lowest in Shimla and Kinnaur (8%), Una (11%) and Kangra (15%). On the other hand, Mandi portrays (38% each) the highest prevalence of severe stunting.

### **12.2 Weight-for-Height (Wasting)**

Weight-for-height describes the current nutritional status. A child who is more than two standard deviations below (-2SD) the reference median for weight-for-height is considered to be too thin for his or her height, or wasted. This condition reflects acute or recent nutritional deficit. As with stunting, wasting is considered severe if the child is more than three standard deviations below the reference median. Overall 22 percent children in Himachal Pradesh are wasted and 10 percent are severely wasted. Analysis by age group shows that wasting ranges from a minimum 15 percent in children age 19-24 months to the maximum 34 percentage in children in age 0-6 months. Children residing in rural areas are more likely to be wasted (22%) than children living in urban areas (21%). There is much difference of weight-for-height/wasted in children from scheduled castes (24%), tribes (18%), others (24%) and other backward classes (11%). Variations by district portray that wasting in children ranges from 0 to 4 percent in each of Lahul & Spiti and Sirmour to 42 percent in Bilaspur.

### **12.3 Weight-for-Age (Underweight)**

Weight-for-age is a composite index of weight-for-height and height-for-age. Thus, it does not distinguish between acute malnutrition (wasting) and chronic malnutrition (stunting). A child can be underweight for his age because he or she is stunted, because he or she is wasted, or both.

Table 8.1 reveals that 29 percent of children under age 5 are underweight and 10 percent are severely underweight. The proportion of underweight children is the highest (38%) among children age 19-24 months and the lowest (25%) among children age 13-18 months. The sex differential in the proportion of underweight children is not pronounced. There is much difference of underweight in rural (29%) and urban (23%) children. Even children from scheduled tribes, scheduled castes, other backward classes and others are relatively more or less similar in underweight. By districts, underweight in children ranges from 50 percent in Chamba to 11 percent in Kinnaur.

### **12.4 Body Mass Index of Women**

In many countries, chronic energy deficiency characterized by BMI of less than 18.5 among adults remains the predominant problem, leading to low productivity and reduced resistance to illness. Prevalence of overweight among women is also a growing problem in developing countries. Overweight individuals are predisposed to a wide range of health problems

including diabetes and heart diseases and also poor birth outcomes for pregnant women. The BMI is used to measure thinness or obesity. It is defined as weight in kilograms divided by height in meters squared (Kg/m<sup>2</sup>). A BMI of less than 18.5 is used to define thinness or acute under nutrition. A BMI of 25 or above usually indicates overweight and a BMI of 30 or above indicates obesity.

In DLHS -4, height and weight measurements in Himachal Pradesh were obtained for 6042 women age 15-49 years who were present in the sample households at the time of survey. Table 8.3 presents percentage of women age 15-49 by their BMI. The mean BMI is 24.8, which falls in the normal BMI classification. About two third (65%) of the women age 15-49 have a normal BMI, 16 percent are undernourished or thin (BMI less than 18.5) and 20 percent are overweight or obese (BMI 25 or higher). It is evident from the table that there is profound variation in BMI by some selected background characteristics of women. Women age 15-19 are more likely to be thin or undernourished (40%) than women in other age cohorts. Rural women are more likely to be thin or undernourished (16%) than their urban counterpart (13%), whereas urban women are 1.5 times as likely to be overweight or obese as compared to rural women (19 and 28% respectively). Educational attainment has seen same with (14%) minimum and (17%) maximum in case of underweight or thin and (19%) minimum and (20%) maximum in case of overweight/obese. Among women who are non literate, nearly (14%) are thin or underweight. There is not clear pattern seen in case of proportion of women who are overweight or obese. Women from Other Backward caste households, having larger potential to have food insecurity, are comparatively more likely to be thin in comparison to those households from other caste-groups. Proportion of ever married women who are thin or underweight is not uniform across districts of Himachal Pradesh. It ranges from the minimum of 7 percent in Lahul & Spiti to 23 percent in Chamba and Srimaur. On the other hand, proportion of women who are overweight or obese is the highest in Solan (32%) and lowest in Chamba and Mandi (9%).

### **12.5 Prevalence of Anemia**

Anemia, characterized by a low level of hemoglobin in the blood, is major health problem in developing countries, especially among young children and pregnant women. Anemia among pregnant women may be an underlying cause of maternal mortality, spontaneous abortion, premature births, and low birth weight. The most common cause of anemia is inadequate dietary intake of nutrients necessary for synthesis of hemoglobin, such as iron, folic acid, and vitamin B12. Anemia also results from sickle cell disease, malaria, and parasitic infections (Benoist et al. 2008)<sup>2</sup>. It is against this background, a number of interventions have been put in place to address anemia in children in developing countries. These include expanded distribution of iron supplements and deworming medication to children age 1-5 every six months.

---

<sup>2</sup> Benoist, B. D., E. McLean, I. Egli, I., and M. Cogswell (eds.). 2008. *Worldwide Prevalence of Anaemia 1993–2005: WHO Global Database on Anaemia*. Geneva, Switzerland: World Health Organization

In DLHS-4, all the usual residents of the selected households including children age 6-59 months were included in the anemia testing, where blood drops were collected using dried blood spot (DBS) method and tested in designated laboratories. The process of blood collection consists of obtaining blood droplets by pricking in the middle or ring finger with a retractable and non-reusable lancet. Before pricking, the finger was cleaned with a swab containing 70 percent isopropyl alcohol and allowed to dry. In case of those children where blood droplets were not possible from middle or ring finger, heel pricking was practiced and DBS were prepared.

Table 8.5 shows the anemia status of children age 6-59 months by some selected background characteristics. Almost three-fifth (59%) of children age 6-59 months suffer from some level of anemia (Hb <11.0g/dl), 11 percent of children have mild anemia and 34 percent have moderate anemia (Hb 7.0-9.9g/dl). Fourteen percent of children age 6-59 months have severe anemia (Hb <7.0 g/dl). The prevalence of any anemia among children age 6-59 months is relatively higher among rural children (60%) than their urban counterparts. The prevalence of any anemia varies significantly by sex of the child and religion of the head of household to which children belong to. Of course, scheduled caste children are comparatively more likely to suffer from any anemia than those from other caste-groups.

The prevalence of any anemia declines sharply among school going population age 6-19 years (45%). The proportions of school going population age 6-19 years who suffer from mild and moderate anemia are 9 and 28 percent respectively. The pattern in decline in any anemia with increasing age is linear in nature with the minimum (44%) among those in the age-group 6 to 10 years and maximum (46%) in those age 17-19 years. Female children and those living in rural areas are more likely to be anemic (Table 8.6). The prevalence in anemia any specific pattern with increasing years of schooling. Scheduled tribe and other backward class are also more likely to be anemic even in the schooling going population age 6-19 years.

Prevalence of anemia declines further in case of adult population age 20 years and above. It is evident from Table 8.7 that 40 percent of adult age 20 years and above are anemic in Himachal Pradesh. Adult women are approximate 1.2 times more likely to be anemic than their male counterparts. Likewise to the school age population (age 6-19), years adults population portrays a uniform prevalence of anemia with increasing age groups. However, there is remains same in the pattern by sex of the adults. There is no significant variation found in education. Rural adult age (age 20 years and above) are more likely to be anemic than their urban counterparts. Increasing years of schooling shows linear decline in the prevalence of anemia in case of women as well as among men age 20 years and above. Other Backward caste portrays a distinct pattern with relatively higher prevalence of anemia even among adult age 20 years and above, which may have definite implication for the food security scheme in the state.

Prevalence of anemia among pregnant women poses much sever health consequences and may be an underlying course of maternal mortality, spontaneous abortion, premature births and low birth weight. Table 8.9 presents the percent of pregnant of women age 15-49

classified as having iron-deficiency (anemia) by degree of anemia and some selected background characteristics.

It is evident from the table that over two-fifths (43%) of pregnant women in Himachal Pradesh are anemic. About 11 percent of them have mild anemia (10.0-10.9 g/dl), 26 percent have moderate anemia and six percent have severe anemia. Pregnant women in Himachal Pradesh who are younger in age (specifically age 20-29), those living in rural areas, non-literate and coming from scheduled caste/other backward caste households are more likely to be anemic.

## 12.6 Prevalence of Diabetes

Diabetes has serious consequences for individuals and poses a large burden on health services, especially in developing countries. According to the International Diabetes Federation (IDF), diabetes poses a daunting challenge to the sustainable development of the nation, as almost every tenth adult in India is estimated to be affected by either diabetes or pre-diabetes (IDF 2011). The latest global figures on diabetes, released by the International Diabetes Federation (IDF), has raised a serious alarm for India by saying that nearly 52% of Indians aren't aware that they are suffering from high blood sugar (IDF, 2013)<sup>3</sup>. In DLHS-4, women and men age 18 and older in the selected households were eligible to have their blood glucose level tested. The blood glucose was measured using portable glucometer namely SD code free, where blood droplets were obtained by pricking in the middle or ring finger with a retractable and non-reusable lancet. Before pricking, the finger was cleaned with a swab containing 70 percent isopropyl alcohol and allowed to dry. In the process, the first two drops of blood were wiped away and third drop was drawn into the glucose strips.

Table 8.10 and 8.12 present data on random blood glucose values for men and women age 18 and above from the sample households included in DLHS-4. Data shows that 7 percent of men age 18 and above and 7 percent of women age 18 and above in Himachal Pradesh suffer from diabetes as the level of blood glucose among those have been 160mg/dL or higher. Another 11 percent of men and 9 percent of women age 18 and above in Himachal Pradesh are pre-diabetic. However, over four-fifth of men as well as women have normal level or even lower level of blood glucose.

Prevalence of diabetes increases linearly with increasing age among men as well as among women age 18 years and above. Men age 60 & above are over 4 times more likely to suffer with diabetes as compared to those in the age-group 18-29 years. The pattern remains by and large same even among women age 18 years and above -2.5 percent in the age group 18-29 years and 14 percent in age 60 years & above (Table 8.12). Men and women age 18 and above who reside in urban areas are more likely to suffer from diabetes than their rural counterparts (1.6 times). Non-literate men and women are more likely to suffer from diabetes than those who have ever attended schools. Level of diabetes prevalence cuts across religion group, which may have implication for the differences in life style and food habits. Adult

---

<sup>3</sup> International Diabetes Federation (IDF). 2011. *Diabetes Atlas, 5th edition*. Brussels, Belgium: IDF

men and women in Muslim religion are more likely to suffer from diabetes than the adult men and women who are from all others religion.

Tables 8.11 and 8.13 present variation in the prevalence of diabetes among adult men and women age 18 and above across different districts of Himachal Pradesh. Among districts, men in Hamirpur have the highest prevalence of diabetes in Himachal Pradesh (12%) followed by Bilaspur and Kangra (9% and 8% each). On the other hand, men in Kinnaur, Chamba and Mnadi (4% to 5% each) have relatively lower prevalence of diabetes among different districts of Himachal Pradesh. The pattern remains by and large the same even if we analyze the prevalence of diabetes among adult women in different districts of Himachal Pradesh. The prevalence is the highest among adult women in Hamipur, Una (9% each) followed by Bilaspur and Solan (8% each).

### **12.7 Prevalence of Hypertension**

Blood pressure rises and falls throughout the day. When blood pressure stays elevated over time. It is called high blood pressure. The medical term for high blood pressure is hypertension. Raised or high blood pressure acts as one of the contributing and intermediate risk factors for developing coronary heart disease, stroke, and kidney disease. The measurements taken for blood pressure in DLHS-4 were not intended to provide a medical diagnosis of the disease but rather to provide a cross-sectional assessment of the prevalence of high blood pressure in the population at the time of the survey. Although the results of the blood pressure measurements are regarded only as a statistical description of the survey population, they provide insight into the size and characteristics of the population at risk for hypertension. The DLHS-4 is used Ross Max AW150 blood pressure monitor model; the automatic devise included separate cuffs for measuring blood pressure in respondents with small, medium and large arm circumferences. Interviewers were adequately trained to use this device according to the recommended protocol. Two health investigators were included in each team for data collection.

Two measurements of both systolic and diastolic blood pressure were taken during the survey at approximately ten minutes interval and the average measurement was used to report respondent's blood pressure values. Tables 8.14 and 8.16 present the information on blood pressure values for men and women age 18 years and above by some selected background characteristics. In the table the blood pressure level has been defined into six categories depending upon various combinations of systolic blood pressure (SBP) and diastolic blood pressure (DBP). The value of SBP greater than 140 mmHg or DBP greater than 90 mmHg is defined as hypertensive with elevated blood pressure, which may have implications for need for medication on a priority basis (AHA, 2003)<sup>4</sup>. In DLHS-4 we have taken SBP 130-139 or DBP 85-89 as the pre-hypertension. It is evident from Tables 8.14 and 8.16 that 20 percent of men and 18 percent of women age 18 years and above in Himachal Pradesh are in the stage of pre-hypertension, while 40 percent men and 32 percent of women age 18 years and above are in the stage of hypertension and require medical attention on a priority basis. There is large proportion of men as well as women age 18 years and above living in urban area are

---

<sup>4</sup> American Heart Association. <http://www.heart.org/HEARTORG/>.

found to be hypertensive than rural counterpart of Himachal Pradesh. The pattern in prevalence of pre-hypertension and hypertension across different districts of Himachal Pradesh are not uniform. Among men age 18 years and above, prevalence of pre-hypertension ranges from a minimum in Chamba (16%) to the maximum in Una district (27%). In case of hypertension, the prevalence ranges from a minimum in Kullu (32%) to the maximum in Una (52%) and Kangra (48%).

In case of women age 18 years and above, the prevalence of pre-hypertension is the lowest in Chamba (10%) among the 12 districts of Himachal Pradesh. On the other hand, Una and Shimla (23% each) and Kullu and Bilaspur (21% each) are some of the leading districts having higher prevalence of pre-hypertension among women age 18 years and above. District wise variation in the proportion of women age 18 years and above suffering with hypertension (  $SBP \geq 140$  or  $DBP \geq 90$ ) also portrays the same pattern with the lowest proportion of women in Bilaspur and Kullu (25% and 26% each) and the highest proportion in Kangra (40%), Una (37%) and Hamirpur (36%).

### **12.8 Use of Iodized Salt**

Salt used in the household is the most common vehicle for iodine fortification to prevent the public health concerns of iodine deficiency disorders. The compound used for fortification of salt is potassium iodide (KIO<sub>3</sub>). According to the World Health Organization, a country's salt iodization program is considered to be on a good track to eliminate iodine deficiency when 90 percent of households use iodized salt. The DLHS-4 made an effort to assess household iodized salt consumption by testing iodine contents in the salt being used by the household. Table 8.18 shows the proportion of households using iodized salt according to some selected background characteristics.

Over all, salt was tested for iodine contain in 87 percent of household in Himachal Pradesh and 55 percent households were found to use salt with adequate iodine contain. Another 30 percent households were found to use salt with iodine but the proportion of iodine contain was not adequate. Urban and Rural household are equally likely to use iodized salts. Analyzing the variation in proportion of household using iodized salt by districts, it is evident from Table 8.19 that it ranges from a maximum in Solan (34%) to the minimum in Srimaur (5%).

## **13. HEALTH FACILITIES**

The basic objective of the population linked facility survey conducted in DLHS-4 is to collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructure at the level of, PHC and CHC, in order to assess the adequacy of RCH services in rural areas.

In DLHS-4 facility survey, at the district level, all Community Health Centres (CHCs), Sub-Divisional Hospital (SDH) and the District Hospitals (DH) were covered. All Sub Health Centres and Primary Health Centres (PHCs) which were expected to serve the sampled population of selected PSU were also covered.

In Himachal Pradesh, the average sampled rural population served per Sub Health Centre, PHC and CHC are 3, 464, 16, 648 and 44, 794 respectively (Table 9.1). In total, villages were surveyed in DLHS-4 and the RCH services of these sampled villages were catered by 280 Sub Health Centres, 153 PHCs and 70 CHCs.

Out of the 280 Sub Health Centres 208 SHCs are functioning in government building, 88 percent have regular electricity (Table 9.2). In three district namely Hamirpur, Una and Solan were having labor room available at SHCs (4%) and rest of the districts SHCs were not having labor room out of this 33.3 percent SHCs where labor room are currently in use. Toilet facility is available in 86 percent of the sampled Sub Health Centre. Around 84 percent of these Sub Health Centres running in government buildings have provision for water supply.

Citizen's charters are displayed in 71 percent of the sampled 280 Sub Health Centres (Table 9.3). The proportion of sampled Sub Health Centre facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 97 percent and 95 percent respectively.

In Himachal Pradesh 93 percent of total 280 Sub Health Centers have Auxiliary-Nurse-Mid-Wife (ANM) in position. State as whole only 3 percent of SHCs have Additional ANM. Fifty two percent of the Sub-Health Centres have male health worker in position. It is lowest in Srimaur district (30%) of Sub-Health Centres have male health worker in position (Table 9.4).

Out of 153 sampled PHCs of the state the number of PHCs are having of Medical Officers, Lady Medical Officers, AYUSH Doctors and Pharmacists in position are 82 percent, 12 percent, 18 percent and 43 percent of the sampled PHCs respectively.

Only 31 percent of the 153 sampled PHCs have residential quarters available for MO. About 16 percent of the sampled PHCs are functioning on a 24 hour basis. About 64 percent of the sampled PHCs catering to the sample villages have at least four beds. Eighty six percent of the PHCs have regular power supply and only 22 percent have functional vehicles (Table 9.6).

Newborn care services are available in 77 percent of the sampled PHCs, 16 percent provide referral services for delivery care, and 24 percent of the PHCs have conducted at least 10 deliveries during last one month prior to the survey (Table 9.7).

Ninety six percent of sampled PHCs have received 'Untied Fund' and almost all the sampled PHCs (100%) have utilized the funds (Table 9.8). Rogi Kalyan Samiti (RKS) has been constituted in 97 percent and the Citizen's Charter displayed in 81 percent of sampled PHCs.

Out of 77 surveyed CHCs, 5 CHCs are having an Obstetric Gynecologist, 6 CHCs having Pediatrician, 7 CHCs having Anesthetist and 6 CHCs having Public Health Manager in position respectively (Table 9.9).

For the state as a whole out of 77 CHCs only 21 have blood storage facility and 27 CHCs have designated as First Referral Units (FRUs). Out of the 77 CHCs around 40 and 53 CHCs

are having functional Operation Theaters (OTs) and newborn care services respectively (Table 9.10).

Out of total 77 CHCs 66 have utilized untied funds, 75 CHCs have constituted RKS and monitored regularly and displayed citizen's charter in 72 CHCs (Table 9.11).

In Himachal Pradesh total 12 Districts Hospitals have surveyed out of this 11 districts hospitals having pediatricians in position and 9 District Hospitals are having radiographers. Nine District Hospitals are having 2D echo facility and 10 District Hospitals are having ultra sound facilities. Three phase connection is available in all districts, critical care area is available only in 6 District Hospitals and suggestions and complaint box are available in all Districts Hospitals.

## **BACKGROUND CHARACTERISTICS**

**TABLE 1.1 BASIC DEMOGRAPHIC INDICATORS**

Basic demographic indicators of Himachal Pradesh and its districts, Census 2011, India.

**TABLE 1.6(a) HOUSING CHARACTERISTICS AND HOUSEHOLD ASSETS**

Percent of households by housing characteristics and household assets goods, by residence, Himachal Pradesh, 2012-13.

Housing characteristics	Total	Residence	
		Rural	Urban
<b>Electricity</b>			
Having electricity	99.7	99.7	100.0
<b>Source of drinking water</b>			
Improved source <sup>1</sup>	96.5	96.1	99.7
<b>Sanitation facility</b>			
Improved sanitation <sup>2</sup>	87.0	85.6	98.3
<b>Fuel used for cooking</b>			
Liquefied Petroleum Gas (LPG)	35.5	29.8	80.6
Electricity	0.3	0.2	0.4
Kerosene	0.4	0.3	0.9
Wood	63.3	69.1	17.6
Others	0.0	0.0	0.1
<b>Type of house</b>			
Kachha	11.8	13.1	2.2
Semi - pucca	30.3	32.4	13.6
Pucca	57.2	53.8	83.7
<b>Number of rooms</b>			
1	5.7	5.1	10.5
2	19.7	18.7	28.1
3+	74.6	76.2	61.4
<b>Household assets</b>			
Radio/transistor	22.8	23.6	16.2
Television	90.5	90.0	94.5
Computer/ laptops without internet	3.3	2.8	7.7
Computer/ laptops with internet	5.1	3.7	16.4
Telephone only	14.6	14.3	16.5
Mobile only	89.3	88.8	93.9
Washing Machine	29.7	26.1	58.3
Refrigerator	52.4	49.2	78.1
Sewing machine	77.9	78.0	76.4
Watch/ clock	88.3	88.2	89.4
Bicycle	6.5	6.2	8.5
Motor cycle/ scooter	18.9	17.5	30.7
Car / Jeep/van	8.2	6.9	18.4
Tractor	1.0	1.1	0.4
Water pump/tube well	1.9	2.1	0.5
Cart driven by animal	0.1	0.1	0.0
Cart driven by Machine	0.1	0.1	0.1
Other cart	0.2	0.2	0.3
Cooler/AC	2.9	2.3	7.8
<b>Number of households**</b>	11,874	10,889	985

<sup>1</sup> Includes piped into dwelling piped to yard/plot, public tap/stand pipe/hand pump,/tube well/ bore well/well covered/spring tanker, cart with small tank and bottled water. <sup>2</sup> includes flush to sewer/septic/twin pit, pit with slab, pit ventilated improved, other. \*\*Unweighted cases.

**TABLE 1.6(b) HOUSING CHARACTERISTICS BY DISTRICT**

Percentage of households with selected characteristics by districts, Himachal Pradesh, 2012-13.

District	With electricity	Improved source of drinking water <sup>1</sup>	Improved access to Sanitation <sup>2</sup>	Using Liquefied Petroleum Gas	Living in <i>pucca</i> house	Having BPL card
Chamba	99.3	97.5	86.1	43.4	42.0	14.8
Kangra	100.0	98.5	72.7	31.3	56.6	14.7
Lahul & Spiti	99.2	62.1	89.2	36.5	42.9	21.8
Kullu	99.8	99.2	89.6	29.4	42.7	12.8
Mandi	99.7	99.7	92.3	39.7	52.0	25.7
Hamirpur	99.7	98.8	97.1	28.1	57.1	21.7
Una	100.0	97.8	81.9	20.6	74.6	22.8
Bilaspur	100.0	98.1	93.6	27.6	74.2	18.9
Solan	99.1	98.5	92.5	44.5	84.2	13.1
Sirmaur	99.8	98.0	78.6	34.3	59.4	21.6
Shimla	99.9	99.2	85.1	51.3	46.2	15.5
Kinnaur	99.8	96.2	82.6	22.2	38.9	17.7
<b>DLHS-4</b>	99.7	96.5	87.0	35.5	57.2	17.9
<b>DLHS-3</b>	98.2	90.3	55.9	24.6	45.5	30.6

Note: <sup>1</sup> Includes piped into dwelling piped to yard/plot, public tap/stand pipe/hand pump, /tube well/ bore well/well covered/spring tanker, cart with small tank and bottled water. <sup>2</sup> Household having access to toilet facility = improved source of sanitation + flush not to sewer/septic/pit/twin pit + pit without slab + dry toilet.

**TABLE 1.7 HOUSEHOLD CHARACTERISTICS**

Percentage of the households by selected characteristics of the household head, household size and residence, Himachal Pradesh, 2012-13.

Characteristics	Total	Residence	
		Rural	Urban
<b>Sex</b>			
Male	86.2	86.6	82.9
