INTERNATIONAL INSTITUTE FOR POPULATION SCIENCES

Vision: “To position IIPS as a premier teaching and research institution in population sciences responsive to emerging national and global needs based on values of inclusion, sensitivity and rights protection.”

Mission: “The Institute will strive to be a centre of excellence on population, health and development issues through high quality education, teaching and research. This will be achieved by (a) creating competent professionals, (b) generating and disseminating scientific knowledge and evidence, (c) collaboration and exchange of knowledge, and (d) advocacy and awareness.”

Preface and Acknowledgements

The District Level Household and Facility Survey-4 (DLHS-4) is a nationwide survey covering 640 districts from 36 States and Union Territories of India. This is the fourth round of the district level household survey which was conducted during 2012-13. The Survey was funded by the Ministry of Health and Family Welfare, Government of India.

At the outset, we acknowledge our sincere gratitude to the Ministry of Health & Family Welfare, Government of India for designating the International Institute for Population Sciences (IIPS) as the nodal agency for conducting District Level Household and Facility Survey-4 (DLHS-4) in India. We would also like to take this opportunity to acknowledge Shri Bhanu Pratap Sharma, Secretary-Ministry of Health and Family Welfare (MoHFW), Government of India for his advice, suggestions and support. Our special thanks are due to Shri Lov Verma and Shri Keshav Desiraju former Secretaries, Ministry of Health and Family Welfare (MoHFW), Government of India, for providing overall guidance and support extended to the project. We gratefully acknowledge the active involvement, assistance, help, co-operation and suggestions received time to time from Shri C.R.K. Nair, Additional Director General, Dr. Rattan Chand, the Chief Director and Shri Biswajit Das, Director-Statistics Division, Ministry of Health and Family Welfare, Government of India. We also extend our thanks to Smt. Madhu Bala, former Additional Director General and Shri Rajesh Bhatia, former Director-Statistics Division, Ministry of Health and Family Welfare, Government of India for their support from time to time.

We gratefully acknowledge the NIHFW, New Delhi, especially Dr. M. M. Misro, Dr. T. G. Srivastava and Dr. Kalpna, for their immense help, assistance, support and coordination with all Partner Institutes to bring out quality DBS results/data. We also acknowledge our sincere gratitude to all Partner Institutes for providing training and support of CAB components and bringing out the quality DBS results.

We sincerely extend our appreciation to HLL Life Care Ltd., New Delhi, for procuring CAB equipments and consumables also supply chain to different states across the country.

Our special thanks are all the members of Technical Advisory Committee of DLHS-4, particularly Dr. N. S. Shastry, Chairman, Former DG & CEO (NSSO) for their constant involvement and technical inputs and support at various stages of the survey.

We also gratefully acknowledge to all members of Sub-Committee on Sampling especially Shri G. C. Manna, Chairman, DDG, CSO, MoSPI for their technical support received from time to time.

Thanks are also due to Dr. Rajiv Mehta and Shri A. K. Mehra former Additional Director Generals at the National Sample Survey Organisations, Kolkata for providing UFS blocks.

We thank Dr. T. K. Roy, Former Director, IIPS, for reviewing the model report and for his useful suggestions.

This acknowledgement cannot be concluded without expressing appreciation for the efforts and hard work put in by the field investigators, supervisors, health investigators in collecting data and timely transferring data to IIPS.

Last but not the least, we are grateful and appreciate the efforts of all the respondents who participated and spared their valuable time with us by providing the required information.

DLHS-4 Coordinators
International Institute for Population Sciences

1. INTRODUCTION AND HOUSEHOLD CHARACTERISTICS

This state report for Haryana pertains to the fourth round of District Level Household and Facility Survey (DLHS-4) 2012-13, following the preceding three rounds undertaken by the Ministry of Health and Family Welfare (MoHFW), Government of India (GoI) in the past (Round-I in 1998-99, Round-II in 2002-04, and Round-III in 2007-08) with the main objective to provide reproductive and child health related database at district level in India. The data from these surveys have been useful in setting the benchmarks and examining the progress the country has made after the implementation of RCH programme. In addition, the evidences generated by these surveys have been useful for the purpose of monitoring and evaluation of the ongoing programmes and the aspect of planning of suitable strategies by the central and state governments. In view of the completion of eight years of National Rural Health Mission (2005-12), that it was a felt there was a need to focus on the achievements and improvements. The Ministry of Health and Family Welfare, Government of India, therefore initiated the process of conducting DLHS-4 and designated the International Institute for Population Sciences (IIPS) as the nodal agency to carry out the survey. MoHFW, provided funds for implementation of DLHS-4, guided by a duly constituted Technical Advisory Committee (TAC).

The main objective of District Level Household and Facility Survey-4 (DLHS-4) is to provide maternal and child care (MCH) indicators and prevalence of morbidity for a wide range of common, communicable, non-communicable and lifestyle diseases for the year 2012-13 covering the following aspects:

- Household basic amenities
- Prevalence of morbidity
- Coverage of ante-natal services and immunization services.
- Proportion of institutional/safe deliveries
- JSY Beneficiaries
- Economic burden of delivery
- Contraceptive prevalence rate
- ASHA's involvement
- Unmet need for family planning
- Awareness about RTI / STI and HIV / AIDS
- Infrastructure, manpower, equipments, drugs, services of public health facilities
- Linkage between health facility and MCH indicators

Bilingual questionnaires prepared in Haryanavi and English language pertaining to Household, Clinical, Anthropometric and Bio-Chemical tests (CAB) and Ever Married Women (age 15-49) were used and canvassed using Computer Assisted Personal Interviewing (CAPI). It was for the first time in the country that large scale demographic and health survey at the district level was successfully carried out by using Computer Assisted Personal Interviewing (CAPI) in DLHS-4. The CAPI software was developed by using MMIC (Multi-Mode Interviewing Capability) tool. Mini laptops were also loaded with CAPI software and bilingual questionnaires and provided to the Field Agencies authorized to carry

out the survey with the designated states. Each team was provided four CAPIs/Mini laptops, one for each investigator. Supervisors were responsible for directly uploading the completed PSU's data to the IIPS, FTP server located in Mumbai on day-to-day basis. The use of CAPI optimized resources were required for transferring the filled questionnaires from field to the state office, data entries and received at IIPS. For the first time biomarkers were also used in DLHS-4. The village and health facility questionnaires were canvassed by using paper & pen method in DLHS-4. In the household questionnaire, information of all the members of the household and socio-economic characteristics of the household, possessed assets, number of marriages, morbidities and deaths in the household since January 2008, and also drinking water, toilet, drainage and kitchen facilities data were collected. The ever-married women questionnaire contained information on women's characteristics, maternal care, immunization and childcare, contraception and fertility preferences, reproductive health including knowledge about HIV/AIDS. The village questionnaire contained information on the availability of health, education and other facilities in the village, and whether the facilities are accessible throughout the year. The health facility questionnaire contained information on human resources, infrastructure, equipments, drugs and services. For the first time, a population-linked facility survey has been conducted in DLHS-4. At the district level, all Community Health Centres, Sub-Divisional Hospitals and District Hospitals were covered. Further, all Sub-Health Centres and Primary Health Centres which cater to the needs of the population of the selected PSUs were also covered. Fieldwork in Haryana for all the 21 districts was conducted during June to December 2013, gathering information from 33,772 households and 28,776 ever married women (15 to 49 years). Table 1.2 provides breakup of PSUs and households by district and rural urban residence.

2. SURVEY DESIGN

DLHS-4 is a district level survey and a multi-stage stratified designed adopted for selection of representative sample of each district in Haryana. Rural and urban areas of a district are considered as natural strata. Wherever applicable, urban population in a district was further stratified into million class cities and non-million class cities. For the purpose of sampling of the urban samples, two-stage sampling was used where the primary sampling unit (PSU) is the NSSO urban frame survey (UFS) blocks and second stage sampling unit (SSU) is the household. The urban PSUs are selected by equal probability without replacement and USU selected by process of circular systematic sampling. The allocation of PSUs to million and non-million class cities was proportional to relative sizes. Distribution of PSUs of a district is proportional to projected urban population of the district. For districts with less than projected 30 percent urban population, urban PSUs are oversampled. The sampling frame used for urban sampling is the town and city wise list of NSSO UFS blocks for 2007-08 provided by the SRD Unit of National Sample Survey Organisation (NSSO), Kolkata.

In rural area of each district, sampling design is two-stage sampling with census villages as PSU and household as the second stage sampling unit (SSU). The PSUs are selected by PPS with replacement and SSU are selected by circular systematic sampling. Large selected PSU with more than 300 households are divided into at least three segments in such a way that each segment has by and large the same number of households and two segments are then

selected by SRS. List of villages in a district in Census 2001 are updated by removing villages of 2001 which have been designated as urban in 2007-08 NSSO UFS block list and this serves as the sampling frame for sampling of rural PSUs from a district.

Selection of rural health facilities in DLHS-4 is linked with the sampled rural PSUs. Primary Health Centres (PHC) and Sub-Health Centres (SHC) catered to the health care needs of the sampled rural PSUs were included in the Facility Survey (FS) of DLHS-4. All Community Health Centres (CHC), Sub-Divisional Hospitals and District Hospitals are covered under the Facility Survey of DLHS-4.

2.1. Sampling Weight

In generating district level demographic indicators, sample weight for household, women and children will be used. The weights for a particular district are based on three selection probabilities

f_1^i , f_2^i and f_3^i pertaining to i^{th} PSU of the district. These probabilities are defined as

$$f_1^i = \text{Probability of selection of } i^{\text{th}} \text{ PSU in a district}$$

$$= (n_r * H_i) / H,$$

Where n_r is the number of rural PSU to be selected in a district, H_i refers to the number of household in the i^{th} PSU and $H = \sum H_i$, total number of household in a district.

$$f_2^i = \text{Probability of selecting segment (s) from segmented PSU (in case the } i^{\text{th}} \text{ selected PSU is segmented)} = \frac{\text{(Number of segments selected after segmentation of PSU)}}{\text{(number of segment created a PSU)}}$$

The value of f_2^i is to be equal to one for un-segmented PSUs.

$$f_3^i = \text{probability of selecting a household from the total listed households of a PSU or in segment(s) of a PSU}$$

$$= (25 * HR_i) / HL_i$$

Where HR_i is the household response rate of the i^{th} sampled PSU and HL_i is the number of households listed in i^{th} PSU in a district.

For urban PSU, f_1^i is computed either as the ratio of number of UFS blocks included in the sample to the total number of UFS blocks of the district.

The probability of selecting a household from the district works out to be

$$f^i = f_1^i * f_2^i * f_3^i$$

The non-normalized weight for the i^{th} PSU of the district is, $w^i = 1/f^i$ while the normalized weight used in the generation of district indicators for the i^{th} district would be

$$= \frac{\sum_i n_i}{\sum_i n_i * w^i} * w^i$$

Where n_i is the number of households interviewed in the i^{th} PSU. The weight for women and children are computed in the similar manner considering corresponding response rate.

3. SURVEY INSTRUMENTS

The main instrument for collection of data in DLHS-4 was a set of structured questionnaires, namely, household, ever married woman, and village questionnaires as components of household survey. In the facility, separate questionnaires are used for Sub-Health Centre (SHC), Primary Health Centre (PHC), Community Health Centre (CHC), Sub-Divisional Hospital (SDH) and District Hospital (DH). Household and ever married women questionnaires are bilingual, with questions in both Haryanavi and English languages.

3.1 Household Questionnaire:- The household questionnaire starts with listing of all usual residents in each sample household including visitors who had stayed the night before the interview. The listing of usual resident members is used for identification of eligible respondents for ever married women and CAB (Clinical, Anthropometric and Biochemical) tests. For individual household member information on age, sex and marital status, relationship to the head of the household and education were collected. Marriages and deaths to members of household were also recorded. Efforts were made to get information about maternal deaths. Information were also collected on the main source of drinking water, type of toilet facility, source of lighting, type of cooking fuel, religion and caste of household head and ownership of durable goods in the household.

An added feature of household questionnaire of DLHS-4 is the collection of data on disability status, injury, acute and chronic illness for all members of the household.

Clinical, Anthropometric and Biochemical (CAB) tests: An important component of household questionnaire is the collection of biomarkers of eligible household members for the first time on a large scale demographic and health survey in the country at district level. This includes weight and height for all household members of age one month and above, Haemoglobin level for all household members aged 6 months and older, random blood sugar test and blood pressure measurements for all household members aged 18 years and above.

3.2 Ever Married Woman's Questionnaire:- The respondents for the ever married woman's questionnaire are ever married women in 15-49 years of age living in the sampled households. Details on age, age at marriage, place of birth, educational attainment, number of biological children ever born and surviving by sex were collected. Accounts of ante-natal checks, experience of pregnancy related complications, place of delivery, delivery attendant and post-partum care, together with history of contraceptive use, sex preference of children and fertility intentions were recorded. For the recent births, immunization status of children was collected either from the immunization card or asking the mother about the status of immunization of the child. The other information collected includes knowledge and awareness about RTI/STI and HIV/AIDS by source and treatment seeking behavior of RTI/STI.

3.3 Village Questionnaire:- This questionnaire was designed to collect information on availability and accessibility of education, health, transport and communication facilities at village level. Functioning of village committees and utilization of fund were additionally collected from the sampled villages. Information relating to implementation and beneficiaries of various government programmes on girl child, maternal care, sanitation, food security,

employment generation, and women's empowerment are also gathered as part of village information.

3.4 Facility Questionnaire:- In the facility survey, the information collected at the SHC level were availability of human resources, physical infrastructure, equipments and essential drugs and MCH service provided in one month preceding the survey. From the PHC, status of availability for 24x7 facility and services for delivery and new born care were collected. Additional information collected at PHC level were availability of Lady Medical Officer, functional Labour Room, Operation Theater, number of beds, drug storage facilities, waiting room for OPD, availability of RCH related equipments, essential drugs and essential laboratory testing facilities. Information that were collected for Community Health Centre (CHC) includes availability of 24X7 services for delivery and new born care, status of in-position clinical, supporting and Para-medical staff, availability of specialists trained for NSV (Non-Scalpel Vasectomy), emergency obstetric, MTP, new born care, treatment of RTI / STI, IMNCI, ECG etc. Physical infrastructure of CHC such as water supply, electricity, communication, waste disposal facilities, OT, Labour Room and availability of residential quarters for medical doctors were also collected in the facility survey. From the Sub-Divisional and District Hospitals status of availability of essential laboratory and ambulance services, emergency obstetric care service, availability of specialists, nurses, paramedics and technicians either on regular or contractual basis were collected in addition to infrastructure, provision for bio-medical and waste disposal and availability of residential quarters for doctors, nurses and staff. The mode of collection of information for health facilities is directly asking to the concerned officials, physical inspection and recording from relevant registers.

3.5 Sample Implementation

The field implementation starts with the preparation of location and layout maps of sampled PSUs in rural areas and obtaining map of sampled NSSO UFS blocks in urban areas. This is followed by preparation of list of households which served as the sampling frame for selection of representative households and it involved mapping and listing of structures and households for each sampled primary sampling unit (PSU) following the preparation of location and layout maps. The mapping and listing was carried out for each PSU by a team comprising of a mapper, a lister and a supervisor. A PSU in rural area is a village or part of a village or a group of small villages and it is NSSO UFS block in an urban area.

From the sampling frame of households prepared by mapping and listing, a sample of 28 households were selected by circular systematic sampling. Household and ever married women's questionnaires were canvassed by a team of 3 female and one male investigators, one supervisor and two health investigators were assigned for collection of CAB information. For quality assurance, field teams were monitored constantly by Project Officers, Officials of PRC, MoHFW, and Partner Institutes who facilitates DBS testing. Time to time DLHS-4 Project Coordinators of IIPS also made field visits to check and provide support to field teams.

4. DEMOGRAPHIC BACKGROUND OF HARYANA

Basic demographic indicators of Haryana and its districts as of Census 2011 are shown in Table 1.1. The population of the state in Census 2011 is enumerated as 25,352 in thousands and population of the state is concentrated mainly in the districts of Karnal, Sonapat, Hisar, Bhiwani, Gurgaon and Mewat. The decadal growth rate of the state during 2001-2011 Census is 19.9 percent. Decadal growth rate during this period is 73.1 percent in Gurgaon, it is the highest in the state and nearly 39 percent in Faridabad and 33 percent in Mewat districts. The sex ratio of the state is low at 879 females per 1000 males; it is lowest (854) in Gurgaon and highest (907) in Faridabad. The overall literacy rate is 75.6 percent and literacy rate is 84.1 percent for males and 65.9 percent for females.

4.1 Sample Coverage

DLHS-4 surveyed a total of 1,259 primary sampling units (PSUs) covering 33,772 households with 95.7 percent response rate and 28,776 ever married women in reproductive age 15-49 years with 91.3 percent response rate. Table 1.2 shows the number of PSUs, households and ever married women interviewed and corresponding response rates by districts. Household response rate in the district varies from 90.4 to 97.5 percents while that for the ever married women it is from 84.7 to 97.8 percents.

4.2 Village Facilities

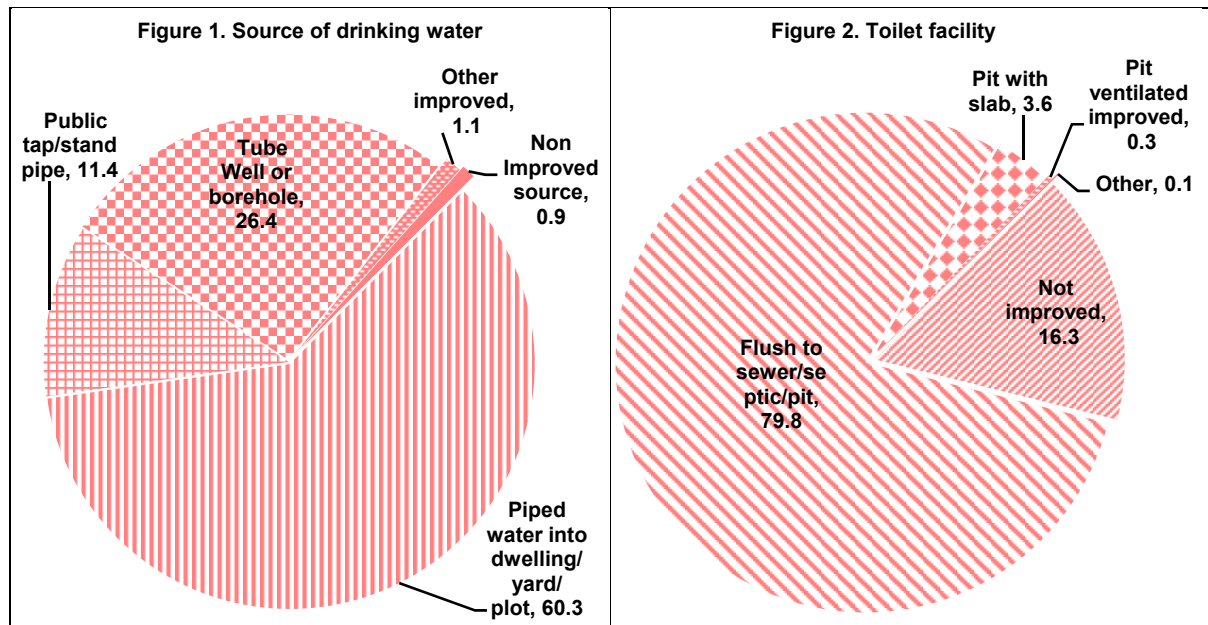

Number of villages surveyed in Haryana is 708 and 33 villages are surveyed from most of the districts. Most villages (93.1%) have a primary school in the village (Table 1.3). In 60 percent of the villages, there is Sub-Health Centre (SHC) (Table 1.4a). Out of total 708 villages 80 percent (565 villages) have beneficiaries of ICDS, while 94 percent have JSY beneficiaries and 86 percent (606 villages) have beneficiaries of JSSK (Table 1.4b). As can be seen from Table 1.15 almost all sampled villages 99 percent have Anganwadi centre, 66 percent have access to any government health facility, 23 and 44 percent of the sampled villages have Primary Health Centre (PHC) and Health Nutrition and Sanitation Committee (VHNSC) in the villages respectively.

4.3 Household Amenities and Characteristics (has to be corrected from here)

As regards housing condition as can be noted from Table 1.6 (a), 69 percent of the surveyed households live in pucca, 7 percent in kachha and 24 percent in semi-pucca houses. As many as 98 percent of households have electricity connection, 23 percent of households use woods for cooking while 46 percent use LPG, 89 percent of households have mobile phone, 85 percent owned television, 42 percent owned bicycle while 41 percent owned motor cycle/scooter and 10 percent owned car/jeep/van.

The sources of drinking water are shown in figure 1 and it is noted that 72 percent of households are using piped water in to dwelling/ yard/plot and public tap/stand pipe for drinking and 26 percent of households are using tube well or borehole water. As can be seen from figure 2, households which do not have access to improved clean toilet constitute 16 percent of the total surveyed households and more than two-third of the households have access to improved flush/septic/pit toilets.

Table 1.6 (b) provides household access to electricity, drinking water, toilet and cooking gas and type of house by districts. The mean household size of the state is 4.9 while it is 5.1 in rural and 4.6 in urban (Table 1.7). One member households constitute 3.5 percent of all surveyed households, 89 percent household heads are male, median age of household members is 48 years. Hindu is the main religion of the state followed by 92 percent of household heads and a significant share 30 percent of the household heads are scheduled castes (SC) and 36 percent of household heads are from the general caste.

The age-sex composition of the population of Haryana is depicted in the population pyramid shown in figure 3. The pyramid is characterized by a shrinking base indicating declining trend in fertility, more males than females in 15-49 years and at older ages.

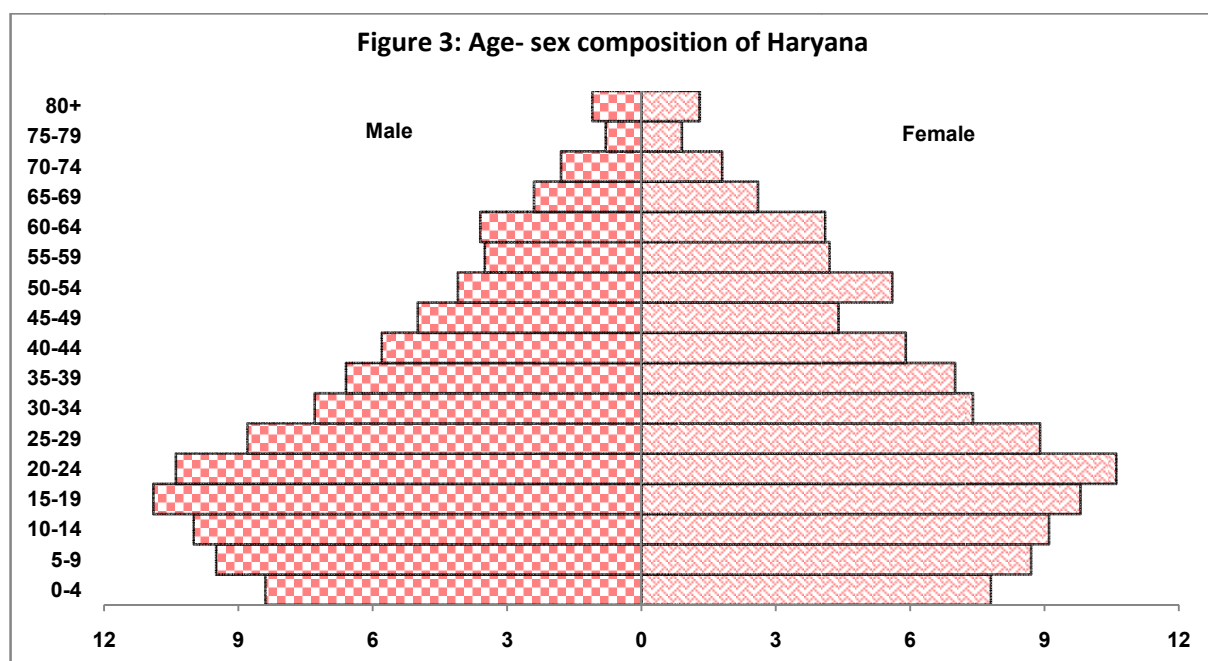

Table 1.8 provides differential in age-sex structures of rural and urban population of the state. As evident from Table 1.9 there is sizeable proportion of unmarried males and females in 20-

29 years and another distinct feature is that there are more widowed/divorced/separated among females than males. The mean age at marriage for girls is 21 years while it is 24 years among boys. Mean age marriage for girls and boys by districts are shown in Table 1.10. Six percent of the marriage among girls is below the legal age of 18 years and 17 percent of the boys got married below the legal age of 21 years. Tables 1.11 through 1.13 provide details about years of schooling of sampled household members by age, sex, caste and religion by rural-urban residence. Among females 7 years and older 0.7 percent are non-literate and corresponding figure among males is 0.4 percent. More among females, 50.1 percent have 11 or more years of schooling as compared to 40 percent among males. Regardless of sex individuals about 24 percent of the literate population has less than five years of schooling. The non-literate persons are less in urban than in rural and more persons have 11 or more years of schooling than among rural residents. Table 1.14 provides rate of current school attendance by age, residence, religion and castes.

Figure 4 shows the school attendance by age, 6-11 years and 12-17 years, the stage of primary and secondary education respectively and sex. The state achieved 98 percent school attendance among 6-11 years children and 94 percent among 12-17 years suggesting the existence of dropout at the secondary level. There is no evidence of sex differential in school attendance among 6-11 years but for 12-17 years school attendance among female is 93 percent as compared to 95 percent among males.

5. CHARACTERISTICS OF WOMEN AND FERTILITY

The distribution by age of women surveyed remains almost constant above age 25 years and above in both rural and urban settings. The age at consummation of marriage is below 18 years is found to be low only 30.1 percent of ever-married sampled women between 15-49 years irrespective of residence background. In rural, 32.9 percent of surveyed women reported their age at consummation of marriage below 18 years. In urban area, 25.1 percent of surveyed women reported that they had started living with husband before reaching at age 18 years (Table 2.1). There are more non-literate women in rural (41.1%) than in urban areas (24.4%). Non-literate husbands are less by 15.4 percentage points compared to non-literate wives/women in rural areas. Around thirty five percent of women are non-literate whereas 36.7 percent of women are educated at least for 10 years. The proportion of husbands with 10 years or more schooling is 44.7 percent in rural, 61.8 percent in urban and 51 percent as combined. Nearly half of the ever-married women (44.5%) were married for 15 years or more

with a marginal difference between rural and urban settings. In case of less than 15 years of marital duration, the distribution of ever-married women in the categories of less than 5 years, 5-9 years and 10-14 years marital duration are almost uniform, with around 18 percent in each category. The proportion of women belonging to Hinduism has been highest and found to be 92 percent followed by 4.5 percent Muslims. The proportion of Muslim women is higher in rural areas (5.4%) as compared to urban areas (2.8%). The proportion of Hindu women is higher (93.9%) in urban areas as compared to rural areas (90.9%). The percent distribution of women by castes/tribes is skewed towards 'Others' (38.2%), followed by women belonging to other backward classes (28.4%) and Scheduled castes (28.1%). The percent of women who belong to Scheduled castes is higher (31.2%) in rural areas than in the urban areas (22.6%).

Table 2.2 shows the distribution of years of schooling among surveyed women by background characteristics. The percentage of non-literate women (21.8%) is found to be lowest in the age group 20-24. More than two fifth of rural women and one-fourth of urban women reported as non-literate in the survey. Relatively higher proportion of Muslim (73.8%) and scheduled caste women (46.7%) are found to be non-literate than other religion or cast/tribe groups respectively. Slightly above one-fifth of surveyed women (22%) had 11 or more years of schooling in Haryana comprising 14 percent in rural and 36 percent in urban. In contrast, only 2.6 percent of Muslim and 11.1 percent of scheduled caste women have 11 or more years of schooling. It is to be noted that at least 7.9 percent of women with 0-5 years of schooling and 3.7 percent of 6-8 years of schooling reported that their husband is non-literate. The percentage of women possessing beyond 11 years of schooling is lowest among Muslim (2.6%). This proportion remains highest (55.2%) for other religion women. Similarly, the proportion of women educated beyond 11 years of schooling is also found to be dismal among schedule castes (11.1%) and scheduled tribes (14.8%) even in state like Haryana.

5.1 Birth Order

Out of the total births since Jan 1, 2008 to ever-married women, around 67 percent births comes from rural areas and the rest 33 percent from urban areas. Almost 43 percent of them belong to women in the age group 25-29, followed by 31.3 percent from women in the age group 20-24 (Table 2.3). The distribution of these births by religion shows that 89.3 percent births belong to Hindus and 7.6 percent to Muslims and rest belong to other than these two religions. The distribution of births by castes/tribes indicates that births from the scheduled castes contribute maximum 33 percent followed by 'Others' (32%) and Other Backward Classes (30%). Out of the total births since Jan 1, 2008 to ever-married women, 58.3 percent were of second or higher order births and the corresponding figures are 71 percent and 67 percent respectively for non-literate and women with less than 5 years of schooling (Table 2.3).

The births of second and higher order are more in proportion among ever-married women aged 15-49 who are from rural area (58.8%), belonging to Muslim (71.9%), belonging to scheduled castes (62.7%), and among 40-45 years or older women (91.1%), compared to ever-married women educated at least up to 10 years (47%), and those belonging (52%) to

other castes (Table 2.3). Table 2.4 shows that the proportion of second and higher order births is the highest in Mewat district (70.3%) and the lowest in Panchkula district (50.8%). The proportion of first order birth has crossed the mark of 45 percent in Panchkula, Ambala, Yamunanagar, Kurukshetra, Rewari and Gurgaon. Each of Hisar, Karnal and Sirsa contributes around 7 percent of the all births.

5.2 Mean Children Ever Born

Mean children ever born (CEB) to ever-married women aged 15-49 years is 2.3 with marginal differential by residence, while it is 2.9 for non-literate and 1.7 to women with at least 10 years of education. The completed fertility measured in terms of average children ever born to ever-married women aged 40-49 years is nearly 3. The differentials by castes/tribes are marginal and ranges between 2 children for 'other' caste and 2.5 children for scheduled castes. Similarly, differential by religion are wide and ranges between 2 children for Sikh to 3.2 for Muslim. The state level estimates for mean children ever born by sex of children are also shown. It indicates that on an average an excess of 0.3 male children to per female children ever born to ever-married women aged 15-49 years in the state as a whole. The sex differentials in mean children ever born to ever-married women aged 15-49 years is found to be higher for 'Others' caste group, non-literates and older women (age 40 years and above). In case of

women 40-49 years, the sex differential in mean children ever born is measured as 0.36. In this age group of women, the gap between male and female mean children ever born is higher among scheduled tribes (0.39), other castes (0.37), and non-literate women (0.36) (Table 2.5).

The mean children ever born to ever-married women by district of Haryana is shown in Figure 5, it varies from 1.9 children in Panchkula and Gurgaon districts to 3 children in Mewat district, while the state average is 2.3 children.

In Haryana, most of the outcomes (92%) of pregnancies which occurred since Jan 1, 2008 to currently married women aged 15-49 years turned to be live birth. Only 5 percent of the pregnancies outcomes are reported as spontaneous abortion. Percentage of pregnancies that resulted in induced abortion is 1.5 percent for the state as a whole. Interestingly, age of

women and sex composition of children depict a large variation in the percentage of pregnancies resulted as induced abortion. For example, women having one daughter only (7.5%) or three daughters only (4.9%) have relatively higher rate of spontaneous abortion. Similarly, women aged above 40 years have a relatively higher induced abortion rate than their younger counterparts (Table 2.6). Percentage of pregnancies resulted into spontaneous abortions varies from 0.8 percent in Gurgaon district to 10.1 percent in Mahendragarh district. The induced abortion rate (3.5%) and still birth rate (2.4%) are found to be highest in district Bhiwani and Sonipath respectively. As a result 92 percent of pregnancies since Jan 1, 2008, among in the low state, are reported as live births, which should draw attention of reproductive and child health programme managers (Table 2.7).

5.3 Fertility Intention and Sex Preferences for Additional Child

Fertility preferences of currently married women in terms of desire for an additional child, timing to have and preferred sex of desired additional child by number of living children are given in Table 2.8. Among those women with no living children, nearly 28 percent wanted a child soon (within the next two years) and around 9 percent wanted a child two or more years later. Among the currently married women aged 15-49 with one living child, 7 percent wanted an additional child soon i.e. within two years. Most of the currently married women with two living children are either sterilized (39.2%) or want no more children (45.7%). In addition, not more than 2 percent of women desired another child once they attain two or more surviving children.

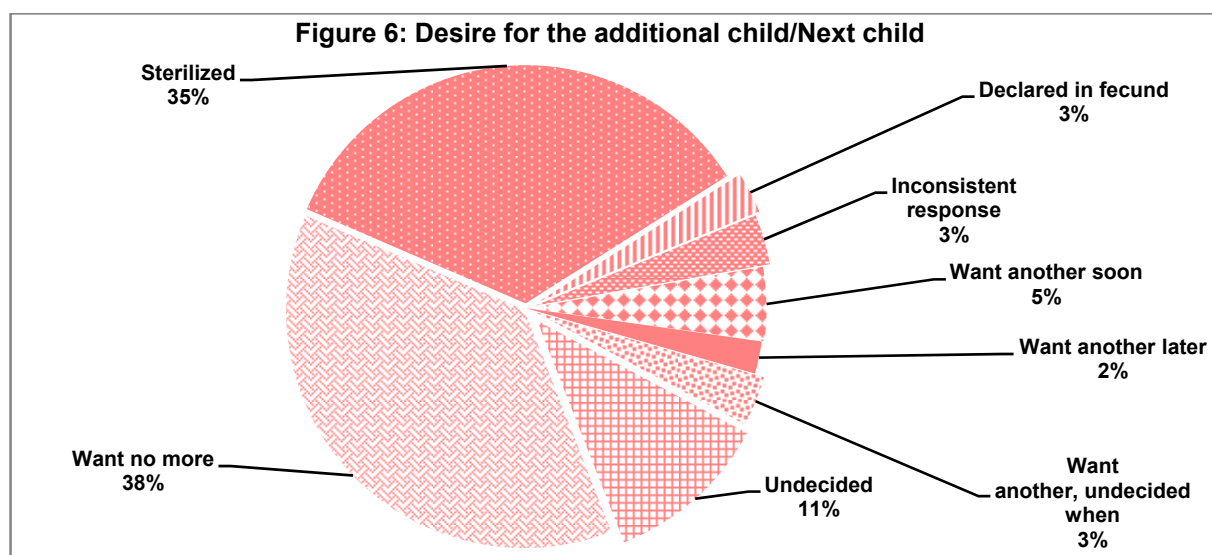

Figure 6 depicts the fertility preference of all currently married women regardless of number of living children. Thirty eight percent of currently married women want no more children, 5 percent want additional child soon, 11 percent are undecided about having an additional child and about 35 percent have undergone sterilization. Among the currently married women with no living children but wanted to have an additional child, 47.8 percent reported that sex of the child does not matter, 46.3 percent say it is up to God while 4.3 and 1.6 percent want to have an additional child as a boy and a girl respectively. Among those who had at least one living child and wanted to have another child, the percentage of women who were able to tell about preferred sex of additional child is quite high (21.2% wanting boy and 11.3% wanting girl).

With increasing number of living children, longing for an additional male child becomes more and more magnified from 21.2 percent among currently married women with one child to 43.9 percent among currently married women with four and more living children (Table 2.8).

6. MATERNAL HEALTH CARE

Maternal Health Care package of RCH components focused on ANC is the main programme under NRHM/NHM programme. The Maternal health care activities are implemented to strengthen and fulfill the RCH goals. ANC services provided by medical and paramedical professionals are comprises of the regular physical checks with weight, height and blood pressure measure, Hemoglobin level test, consumption of IFA, Tetanus (TT) injection and growth status and position of fetus. These primary services are made compulsory to be provided during the ANC check up from health facility. At least four checkups are made compulsory to complete the full ANC course in order to prevent and protect women from pregnancy related complication faced during the pregnancy and till the delivery. Janani Suraksha Yojna (JSY) scheme is implemented in health facilities under the aegis of NRHM/NHM to promote the Institutional Delivery and post natal care to prevent from maternal deaths.

6.1 ANC by Selected Background Characteristics

In Haryana, 71 percent of the women had received at least one antenatal care (ANC) service during the pregnancy of their last birth in the three years period preceding the survey. Utilization of government health facility for ANC care is around 64 percent compare to 52 percent of private health facility (Table 3.1).

Any ANC coverage by selected background characteristics are illustrated in Figure 7. Any ANC received among the non-literate are 50 percent as against 82 percent among the women educated for 10 or more years. There is significant marginal rural-urban gap of 10.5 percentage point in availing any ANC, with 78 percent among urban residents and 67 percent among rural residents. Women who had received ANC with one living children is 77 percent whereas women with 4 and above living children is 54 percent.

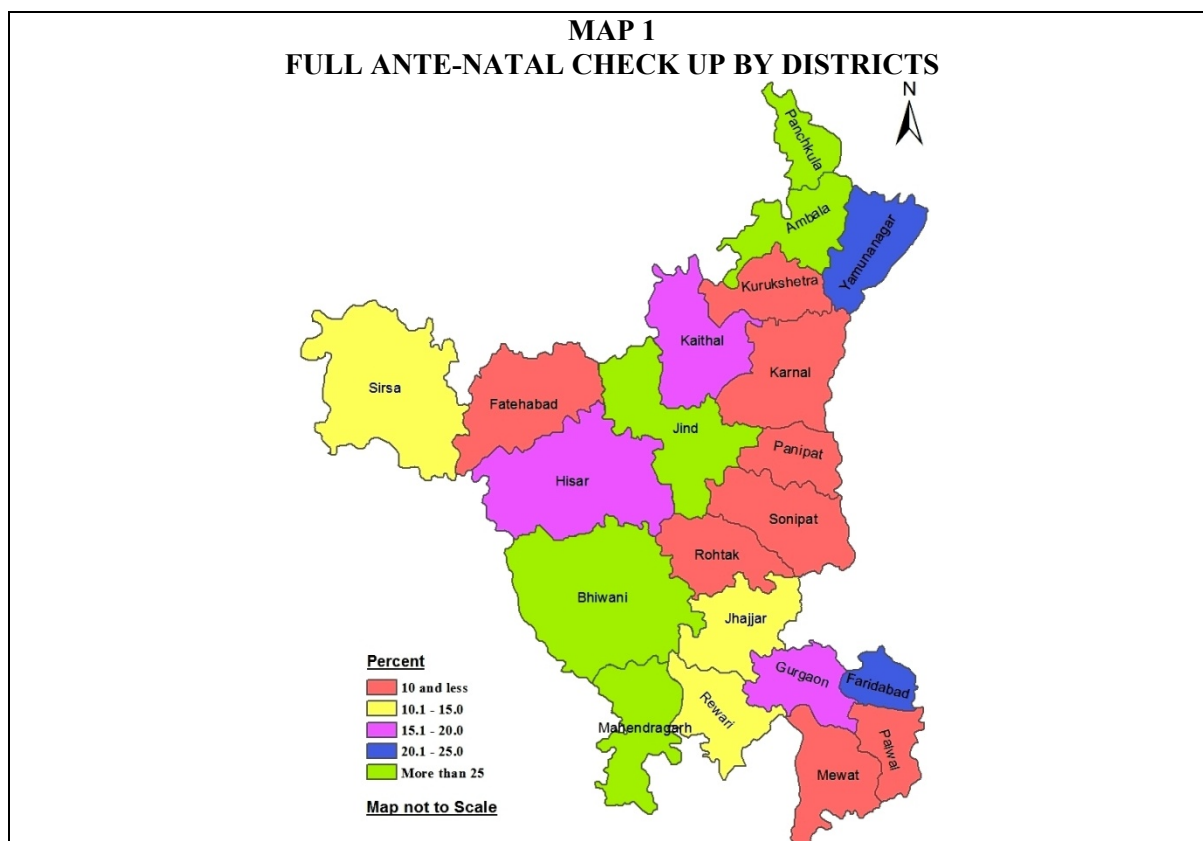

The coverage of any ANC is highest in Panchkula district (88%) and lowest in Mewat and Sonipath district (45.6%). Majority of women from Panchkula, Kaithal,

Mahendragarh, Ambala, Mewat, Bhiwani and Jhajjar district are availed ANC care from government health facilities (71 to 87%). The lowest ANC coverage in government health facilities was in Panipath district (29%), where women prefer more the private health facilities. The DLHS-4 data reveals that more women availed from government health facilities for ANC as compared to private health facilities.

The specific components of ANC checkup which are supposed to be received by the women during the pregnancy were asked to response. The proportion of women who received weight, height and blood pressure measurement, blood and urine tested, abdomen examined and sonography/ ultrasound test done are 61.2, 25.7, 41.1, 49.7, 51.9, 34.5 & 56.5 percent respectively (Table 3.3). One important feature of ANC check up in Haryana in case of ultrasound test done is high among women who are having one children than four or more living children (63.8% and 36.4% respectively), having ten years of education (68.3%), rural-urban residence (52.8% and 63.7% respectively), and Sikh religion (59%). The women from other caste are the highest (64.5%) as compared to all others castes. The detail is shown in Table.3.3.

The proportion of women who had received at least three ANC (45%) and the women who had received first ANC in the first trimester of the pregnancy (50%) (Table 3.5A). The proportion of women who had three ANC are highest among women who have one living children (52%), having 10 years and above education (55%), urban residence (52%), Sikh religion (58%), other caste (52%). There is no much difference by age group between 15-35 years. The women who had full ANC (i.e. at least 3 ANC visits with 100+ IFA tablets/ Syrups consumed at least 1 TT) in Haryana is 15 percent. But 58 percent of women had 2 TT+ injections against 20.9 percent who had consumed 100+ IFA tablets/Syrups. The proportion of women who had received full ANC is highest in Mahendragarh district (37%) and lowest is 1.6 percent in Mewat district (Table 3.6). District wise variation in coverage of full ANC is shown in the Map 1. The proportions of women who consumed 100 IFA tablets/syrup and received at least one TT injection are 15 percent and 66 percent respectively in Haryana during DLHS-4 (Table 3.6).

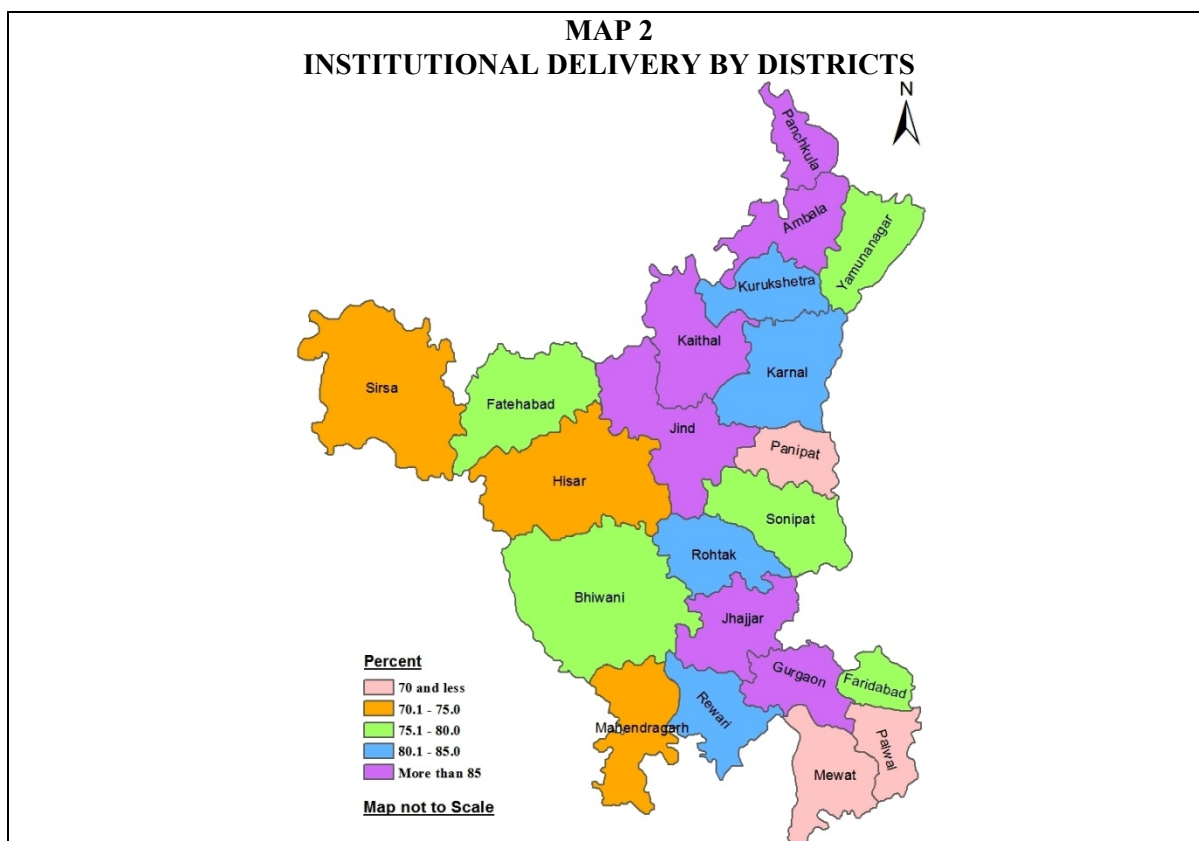

6.2 Institutional Delivery

In Haryana, the institutional delivery increased from 26 percent in DLHS-1 (1998-99) to 35 percent in DLHS-2 (2002-04) to 47 percent in DLHS-3 (2007-08) and further substantially increased to 77 percent in DLHS-4 (2012-13). The institutional delivery in Haryana is presented in the Figure 8.

Around 77 percent of deliveries in the three years period preceding the survey which results either in still or live births were in both government and private health facilities, (Table 3.7). The proportion of women having background of ten years or more education (88%) and having one living child (86%) are going for institutional delivery. The percentage of institutional delivery ranges from 94 percent in Panchkula to 51 percent in Mewat districts (Table 3.9). Around 91 percent of Skilled Birth Attendant (SBA) delivery shows that safe delivery is practiced in Haryana. The home delivery cases (22.5%) who are assisted by skilled persons is only 14.1 percent. The mean delivery cost in Haryana ranges with a maximum of Rs.10,309 in Mahendragarh district and minimum is Rs.3,648 in Gurgaon district. In Haryana, out of the 21 districts, only 4 districts are having the institutional delivery 90 percent and above and in remaining 17 districts the percentage is varies from 51-89 percent of Institutional delivery.

In Haryana, 24.9 percent of institutional delivery used ambulance and 31.6 percent jeep or car for transportation of delivery with an average cost of Rs.1,058. The use of ambulance for transportation for institutional delivery was low among women with background of having zero living children (16%), 10 or more years of education (21.9%), Muslim (17.1%) and Other caste (21.8%). The mean delivery cost is Rs.3,464 in government health facilities and Rs.10,222 in private health facilities. There is a large variation of Institutional Delivery cost compare to government and private health facilities.

The JSY financial assistance for institutional delivery had benefitted to 8.3 percent and Home delivery 2.6 percent (Table 3.8). The highest benefitted women for institutional delivery are those in the age group of 25-29 years (8.8%), rural residence (9.5%), having 3 and above living children (11.1%), Hindus (8.4%) and scheduled castes (13.2%).

6.3 Complications during Pregnancy, Delivery and Post-delivery Period

Women who either do not take ANC or take an incomplete course of ANC are exposed to the risk of maternal death. In Haryana as much as 37.5 percent women who had still/live births in the three years preceding the survey had some complications during pregnancy (Table 3.6). Out of 21 districts, in 8 districts women faced pregnancy complication percentage ranges from 56 percent in Sonipath to 40.7 percent in Panchkula. The remaining 13 districts' women faced pregnancy complication ranges from 15.1 percent in Palwal to 40.0 percent in Kaithal. Forty five percent of women who had reported complication during pregnancy had sought treatment for the problem in Haryana (Table 3.15).

Around 42.9 percent of women in Haryana had faced at least one delivery complication. The main type of delivery complications experienced by women who had still or live births in the

three years period preceding the survey are mainly premature labour (61%), obstructed labour (43.7%), prolonged labour (17.5%), excessive bleeding (10.7%) and convulsion or high Blood pressure (5.6%). Delivery complication is higher among those who undergone by caesarean (54.6%) compared to normal delivery (41.7%) (Table 3.11). In all the districts of Haryana, in Yamunanagar district is the highest proportion of women who had a delivery complication (66.6%) and is lowest in Faridabad (27.7%) (Table 3.15).

In Haryana, around 15.2 percent women had faced post-delivery complications. The major problem during post delivery period is high fever (52.4%), lower abdominal pain (49.5%) and followed by excessive bleeding (15.6%) (Table 3.12). Among the women who had post-delivery complications 53.3 percent had sought treatment (Table 3.15). In all the districts, women sought treatment for post delivery complication with highest in Mahendragarh (86.2%) and lowest in Rohtak district (35.9%).

7. CHILD HEALTH AND IMMUNIZATION

To promote child survival and prevent infant mortality, NHM/NRHM envisages new born care, breastfeeding initiation, infant food supplementation at the right time and a complete package of routine immunization for children. About sixty percent of newborns were examined within 24 hours of birth (Table 4.1). In Haryana, women who availed newborn care from government health facility constitute 49.9 percent as compared to 42.9 percent from private, at home (6.4%) and others (0.7%). There was a substantial increase from DLHS-3 (22.9%). There is variation in rural areas in utilization of government health facilities (56%) and private health facilities (36.3%), whereas in urban areas it is 38.3 percent for government health facilities and 55.6 percent for private health facilities. Majority of women from Scheduled castes and Scheduled tribes communities check-up in government health facilities (60.5% & 55.2%) than in the private health facilities (32.4% & 31.6%). Other back ward classes also use government health facilities (52.9%) more than private (39.2%) (Table 4.1).

Majority (84%) of children under 3 years of age (born after January 1, 2008) were fed with colostrums and there is not much variation across selected background characteristics of women (Table 4.2). Highest proportion of children being fed with colostrums (95.3%) is observed in Faridabad district and the lowest in Panipat district (73.9%) (Table 4.5).

In Haryana, only 50.9 percent of women had initiated breastfeeding within one hour of the birth of the child. Among the women, initiation of breastfeeding within one hour of birth is least practiced in Panipat district (32.2%) and most widely practiced in Rewari (69%). However, 82.8 percent of women in Haryana initiated breastfeeding within 24 hours of birth of their children, ranging from 66.2 percent in Panipat district to 97 percent in Faridabad (Table 4.5). The proportion of women who initiated breastfeeding within one hour, within 24 hours and after 24 hours of birth are 51, 83 and 8.5 percent respectively.

Duration of exclusive breast feeding practiced is high (among infant under 2 to 5 months old) and is ranged from 59.7 to 46.6 percent and it declines as the age increases in Haryana. The introduction of food supplementation with semi-solid and solid food started below the age of 2 months along with breastfeeding. As the age increases the percentage of the breast feeding

declines and 19 percent of children under 24 to 35 months were breast fed along with other fluids, semi solid and solid foods (Table 4.3).

7.1 Immunization Coverage of Children (aged 12-23 Months)

The immunization coverage of children (aged 12-23 months) has been recorded either from vaccination card or by asking the mother in case the card was not available. About 27 percent of children's immunization was recorded from the cards (Table 4.7). The full immunization coverage was 52.1 percent among children (aged 12-23 months). The full immunization comprises of BCG, three doses of DPT & Polio and measles (Table 4.6). In Haryana, the coverage of BCG and measles are 84 percent and 70 percent respectively. About 7 percent of children have not received any immunization.

In the districts of Haryana, the highest coverage of full immunization was in Kaithal with 74 percent and lowest in Mewat with 27.4 percent. Out of 21 districts of Haryana, 13 districts recorded full immunization coverage less than 60 percent whereas the remaining 8 districts had more than 60 percent coverage (Table 4.7). The coverage of BCG is above 75 percent in all districts except Sonipat (55%) and Mewat (53%). In case of measles the coverage fluctuates from 40.2 percent to 87.9 percent in the districts, for DPT it ranges from 50.2 percent to 93.6 percent and coverage of Polio 3 ranges from 45.2 percent to 86 percent. Higher proportion of children (58.4%) of women educated up to 10 years and above received full immunization. About 41 percent of children of Non-literate women's received full immunization (Table 4.6). In Haryana full immunization coverage of children (aged 12-23 months) in urban areas (54.5%) is higher than in rural areas.

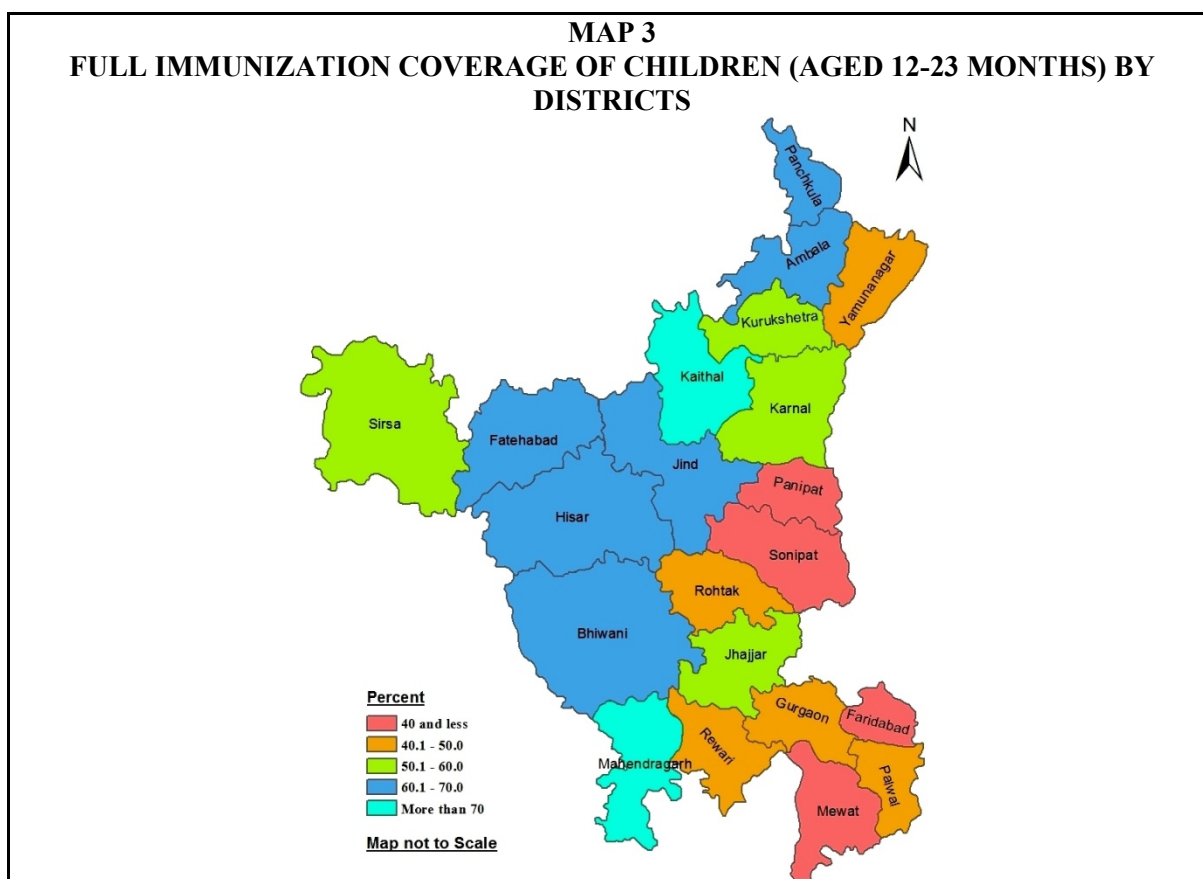

The coverage of full immunization decreased from DLHS-1 to DLHS-3 (from 66 to 60%) and has further decreased by eight percent point in DLHS-4 (52%) as depicted in figure 9. The coverage of full immunization of children is below 50 percent in Panipat, Rohtak Sonipat, Rohtak, Rewari, Gurgaon, Faridabad and Mewat while it is more than 50 percent in remaining districts (Table 4.7).

With regard to the place of vaccination of children, it was reported that 47.3 percent children received it from a Anganwadi-Centre, 10.6 percent from Sub-Health Centre and 33.2 percent from other government health facility (Table 4.8). District-wise variation in the coverage of full Immunization is depicted spatially in Map 3.

Proportion of children aged 9-35 months who received at least one dose of Vitamin-A is 61.4 percent and who received 3-5 doses is 43.3 percent in the State (Table 4.9). In Karnal district 80.5 percent of children aged 12-35 months received at least one dose of Vitamin-A, while in Sonipat and Mewat districts less than 50 percent of children received Vitamin-A (Table 4.7). Panchukula, Kurukshetra, Kaithal and Mahendragarh are other districts of Haryana where coverage of Vitamin-A is more than 70 percent and in remaining districts the coverage of

Vitamin-A is above 50 percent (Table 4.7). Higher proportion of children received one dose of vitamin A whose mother is educated 10 or more years (69.4%), living in urban area (64.4%) and belongs to other caste (63.9%) than their counterparts (Table 4.9).

About 58 percent of children in Haryana had received Hepatitis-B vaccination. There is not much difference between children living in urban and rural areas (Table 4.9).

7.2 Management of Diarrhoea and Acute Respiratory Infection (ARI)

The information on knowledge of diarrhoea and ARI management was collected from women respondents as part of assessment of child care knowledge. Majority of women (82%) have knowledge of diarrhoea management (Table 4.10) and more than 75 percent of the women are aware of danger signs of ARI (Table 4.12).

The common practice followed by women for treatment of children who had diarrhoea was to give ORS (68%), salt and sugar solution (54%), plenty of fluids (32%), continue normal food (25%) and continue breastfeeding (15%) (Table 4.10). In Haryana, 45 percent children who suffered from diarrhoea were treated by ORS, while 69 percent of them were given some treatment or the other (Table 4.11). Majority (79%) of children who had suffered from diarrhoea are treated in a private health facility and 22.3 percent in a government health facility (Table 4.11).

In Haryana, 75.2 percent of women are aware of danger signs of ARI. Among them, 46 percent of women knew that difficulty in breathing, 37 percent knew pain in chest and productive cough, 27 percent consider rapid breathing, 24 percent knew wheezing/whistling, and 30.1 percent having knowledge of others signs of ARI (Table 4.12).

More than three percent children had suffered from ARI in the last two weeks prior to the survey. Out of total children suffered from ARI, 85 percent had sought advice/treatment. Majority (71%) of children had treatment at private health facility and only 30 percent went to government health facility (Table 4.12).

The prevalence of ARI among children varies from 0.3 percent in Ambala district to 7 percent in Bhiwani district. The treatment seeking for ARI or fever is 90 percent and more in the districts of Ambala, Yamunanagar, Kurukshetra, Sirsa, Bhiwani, Mahendragarh, Rewari and Faridabad (Table 4.13).

8. FAMILY PLANNING AND CONTRACEPTIVE USE

Family planning program in India has undergone sea changes in terms of strategies, focus and objectives. Post ICPD 1996 programme oriented has evolved itself in to human right framework keeping in mind the central point to reduce the unmet need for family planning. Strategies under NRHM were to create demand for family planning through enhancing child survival and improving maternal health.

There is awareness to the extent of 84 percent about female sterilization but male sterilization is known to only 55 percent of women. Nearly half of the women know about IUD, Condom/Nirodh and Pills respectively. The knowledge of traditional method is 32 percent among women in Haryana. However new methods on menu of Indian program/or in market like female condom is known only 14 percent among women. Female sterilization is the predominant limiting method being used by 34 percent of currently married women in 15-49 years and popular male oriented spacing or temporary method is Condom/Nirodh having being used by 14 percent of husbands of currently married women. Among the currently married women the proportion ever using any modern method is about 53 percent, while 55.3 percent of women ever used either modern or traditional methods. There is no substantial rural-urban difference in the ever use of any modern contraceptive use. However, female sterilization among rural women is 37 percent which comparatively more than among urban women with corresponding figures is 28 percent.

The status of current contraceptive use among currently married women or their husband shows that almost half of them were using one or other modern method mostly female sterilization (34%) at the time of survey. Condom/Nirodh is in use by only 10 percent of currently married women's husbands which is same as it was in DLHS-3. The female sterilizations are more among rural women (37%) and non-literate (44%) women compared to that among urban women (28%) and women educated for at least 10 years (22%).

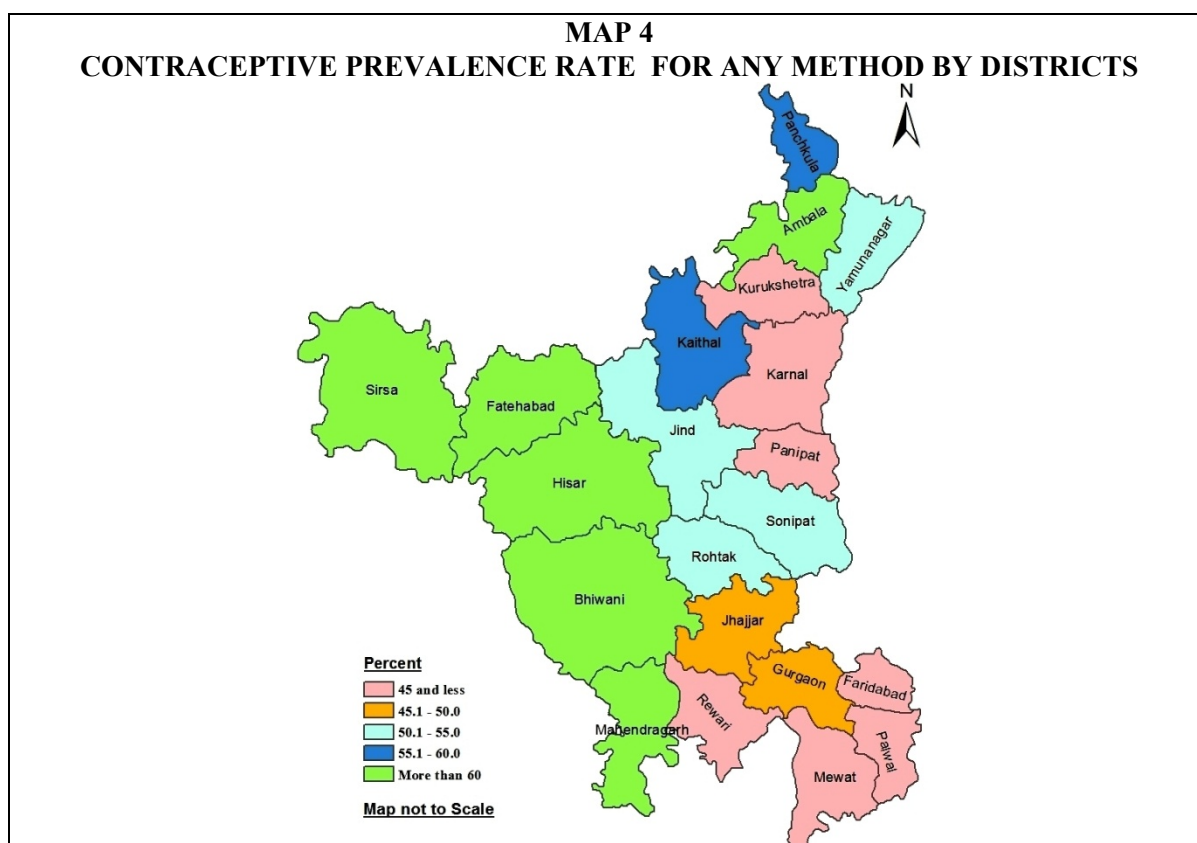

Female sterilization regardless of family size is more among currently married women who have one or more living sons compared to those with no living son. Nearly 7 percent of women in 20-24 years, 20 percent of women in 25-29 years and about 34 percent of women in 30-34 years have been found to have undergone female sterilization at the time of survey. The mean age at the time sterilization is 29 years. Among the currently married women, proportion continuing IUD use for less than 2, 2-3 and more than 3 years are respectively 21, 13 and 52 percent respectively. Oral pill users continuing for more than 6 months constitute 59 percent of the total pill users and 64 percent of condom users are continuing for longer than 6 months.

Contraceptive prevalence rate (CPR) for any modern method is above 50 percent in following districts namely Panchkula, Ambala, Kaithal, Sonipat, Fatehabad, Sirsa, Hisar, Bhiwani, Rohtak, Mahendragarh which lies between 50 to 66 percent. Highest CPR for any modern method is 65 percent in Mahendragarh district and lowest is 26 percent in Palwal district. The prevalence of female sterilization in half of the total number of districts are above the state average of 34 percent. The contrast in the source of terminal and temporary methods of contraceptive is that 79 percent of sterilization has been done in government health facility and 24 percent have availed government health facility service for spacing methods. The high and low utilization rate of government health facility for limiting and spacing methods is true for all the districts of Haryana. Thirty five percent of sterilized women and wives of sterilized men got monetary compensation for sterilization, with variation of lowest 17 percent in Sonipat and highest 54 percent in Karnal district. As many as in 81 percent of sterilization cases monetary compensation is given at the time of discharge.

Nearly 11 percent of sterilized women, 20 and 15 percent, users of IUD and Pills were informed about the side effects before the adoption and 3, 4 and 2 percents of women using the aforesaid methods have experienced side effect or health problem. Among the currently married women who have discontinued contraception, the main reason cited is related to other method (43%) while 29 percent mentioned fertility related problems and 29 percent mentioned side effects. For the younger women in 15-29 years reasons for discontinuation of contraception are mostly fertility related and it is also true for women with no or one living children.

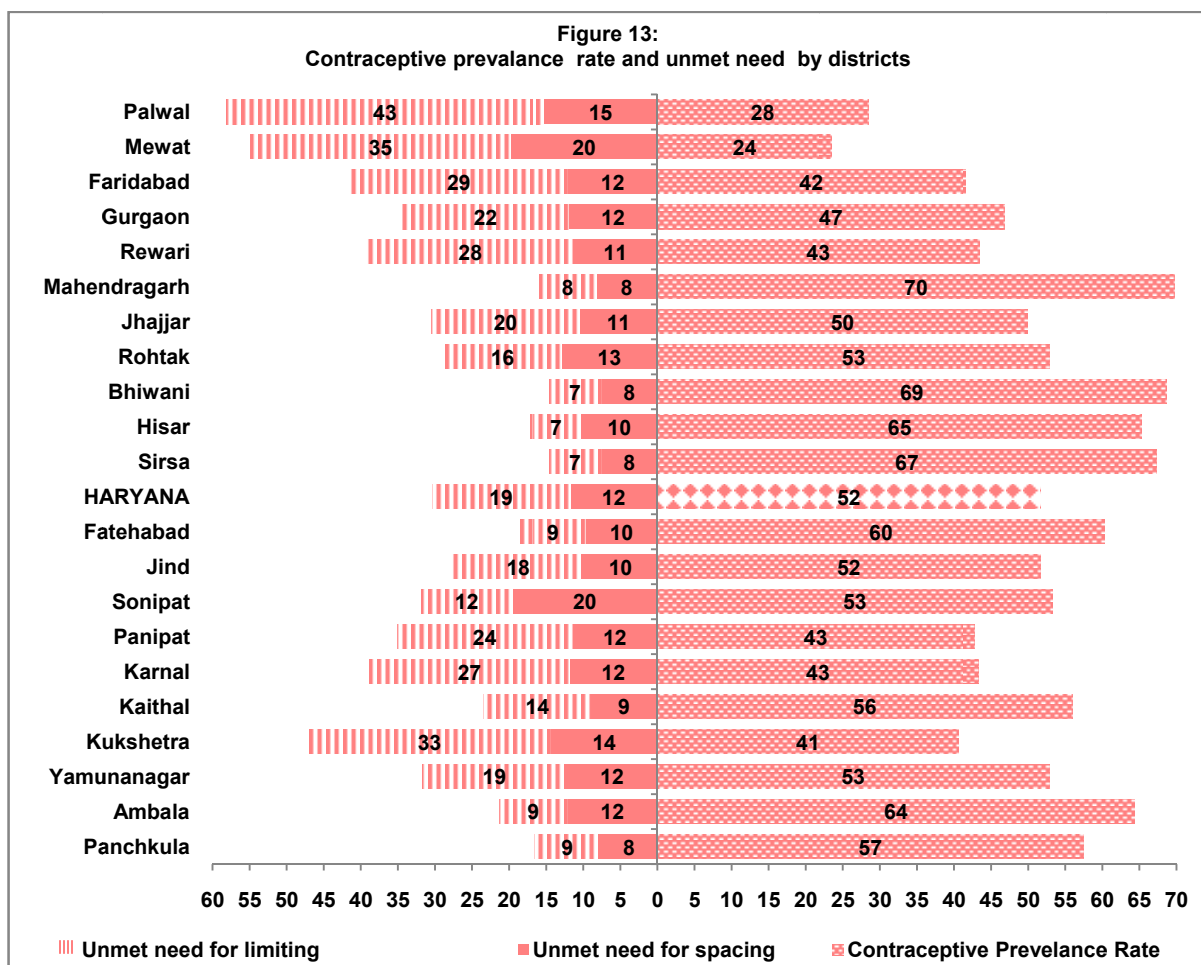

About 6 percent of currently married women aged 15-49 years, not using any contraception intend to adopt limiting method and 3 percent spacing method in future. Those who intend to adopt either limiting or spacing methods in future within 12 months, after 12 months and still undecided about the timing constitute 36, 20 and 44 percents respectively.

Unmet need for spacing includes the proportion of currently married women who are neither in menopause nor had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing. In Haryana 12 percent of currently married women have unmet need for spacing. The unmet need for spacing is 6 percent for women with 4 or more living children and 36, 29, 16 percents for women aged 15-19, 20-24 and 25-29. On the other hand, currently married women who are still have physiologically potential for conceiving and want no more children are categorized as having unmet need for limiting. The unmet need of contraceptive for limiting is about 19 percent in the state.

Currently married women with unmet need for spacing is highest in Sonipat and Mewat districts (19%) and lowest around 8 percent in Panchkula, Sirsa and Bhiwani districts. On the other hand unmet need for limiting is highest in Palwal (43%) and lowest is Hisar (7%).

The total unmet need of contraceptive has been almost constant in DLHS-2 to DLHS-3. It was 15 percent in 2002-04 and in 2007-08. In DLHS-4 (2012-13) it seems unmet need has substantially increased to 30 percent. This is basically due to higher unmet need for spacing among the younger cohort, a sign of decline in the desire for large family size. District wise contraceptive prevalence rate and unmet need are presented in figure 13.

9. REPRODUCTIVE HEALTH

Reproductive health addresses the issue of reproductive processes, encompassing the functions and system at all stages of life. The reproductive health, is the ability for the people to have a responsible, satisfying and safe sex life and have the capability to reproduce and the freedom to decide if, when and how often to do so. This means that the right of men and women alike are to be informed of and to have access to safe, effective, affordable and acceptable methods of fertility regulation of their choice, and the right of access to appropriate health care services that will enable women to go safely through pregnancy and childbirth and provide couples with the best chance of having a healthy infant. The burden of diseases among women is due to reproductive function and system. The five main causes of the disease burden among women in developing countries are maternal, Sexually transmitted disease, tuberculosis, HIV infection, Depressive disorders. DLHS-4 has obtained information on awareness and prevalence of RTI/STI, HIV/AIDS, information and ways to avoid AIDS.

9.1 Menstruation Related Problems

The women reported to have menstruation related problems and have specific symptoms during three months preceding the survey by background characteristics is given in Table 6.1. Menstrual problems are experienced by 6.5 percent of women in Haryana. The problems of painful periods (48.5%) and irregular period (36%) are the main menstrual problems experienced by women. The other problems reported are frequent or short periods (15%),

prolonged bleeding (14%), scanty bleeding (7%), absences of periods (13%) and blood clots/excessive bleeding (4%). The differentials in menstruation related problems are found by age, place of residences and education of both husband and the women. Women who had consummated their marriage below 18 years of age have had more menstruation related problems (7%). The menstrual related problems also increased with duration of marriage. Around 7 percent of women had reported to have menstrual problems whose marital duration was 10-14 years and just above 7 percent for women whose marital duration was more than 15 years. The menstrual related problems did not differ drastically by caste and religion.

9.2 Awareness of RTI/STI

The awareness of RTI/STI was obtained from ever married women. The women who are aware about RTI/STI were further asked on the modes of transmission and symptoms of the disease. Table 6.2 shows the percentage of women who have heard of RTI/STI by background characteristics. About one-fourth of women in Haryana had heard of RTI/STI. The proportion of women who were aware of RTI/STI was comparatively higher in urban areas (34%) than in rural areas (20%). Awareness of RTI/STI was lower among young women, women with low age at consummation of marriage, non-literate and women from Scheduled tribes. Awareness of RTI/STI increases with education of women. Thirty seven percent of women who had completed ten or more years of schooling were aware about RTI/STI.

Television is an important source of knowledge about RTI/STI, 66 percent women reported they had heard about RTI/STI from TV. Forty five percent of women reported Leaders/Community meeting as source of knowledge of RTI/STI. Another major important sources of information about RTI/STI are from print media (39%), cinema (33%), health personnel (20%). The sources of knowledge about RTI/STI differ by education of women and husband.

9.3 Knowledge Regarding Mode of Transmission of RTI/STI

The knowledge regarding mode of transmission of RTI/STI was asked to women who had heard of RTI/STI (Table 6.3). About 43 percent of women reported unsafe delivery, 40 percent unsafe abortion, 33 percent unsafe IUD insertion, 30 percent unsafe sex with persons who have many partners and 21 percent who have unsafe sex with sex workers as a mode of transmission of RTI/STI. More than one fourth of the women reported that unsafe sex with homosexuals were also as mode of the transmission of RTI/STI. The knowledge varies by residence, age at consummation, education of women and education of the husband.

Table 6.4 shows the common symptoms of reproductive tract infections/sexually transmitted infections among women. More than 12 percent of ever married women have reported having symptoms related RTIs/STIs and 6 percent experienced abnormal vaginal discharge. The women reported itching or irritation over vulva (3%), pain in lower abdomen not related to menses (3%). More than 55 percent of women discussed the RTI/STI related problems with their husband or partner (Table 6.5). The women mostly sought treatment for RTI/STI (72%) from private health facility.

The women who have heard about RTI/STI varies from 7 percent in Panipath district to 56 percent in Panchkula district. The districts where more than one-third of the women have heard about RTI/STI are Kaithal, Jind, Hisar, Bhiwani, Jhajjar, Gurgaon and faridabad. Women reporting any abnormal vaginal discharge varied from 2 percent in Ambala district to 11 percent in Mahendragarh district. More than half of the women in five districts (Panchkula, Yamunanagar, Fatehabad, Sirsa and Mahendragarh) had Sought treatment for any RTI/STI including abnormal discharge.

9.4 Awareness of HIV/AIDS

The awareness on HIV/AIDS was asked to ever-married women age 15-49 years. More than 52 percent of the women had heard about HIV/AIDS. Television is the one of the major source of knowledge on HIV/AIDS. Ninety percent of women reported that TV is the main source of knowledge on HIV/AIDS, followed by cinema and Community's leaders meetings (43% each), print media (36%), school adult education programs (31%), health personal (22%), husband (6%) and radio (9%) (Table 6.7). More than half of the women reported unsafe sex with person having many partners, transfusion of infected blood (51%) and sharing of injection/needle (43%) as mode of transmission of HIV/AIDS (Table 6.8). The reported modes of transmission of HIV/AIDS differ by residence, education of women and husband.

Table 6.9 shows knowledge of methods of preventing HIV. About two-fifth of women were of the view that HIV/AIDS can be prevented by avoiding risks of getting infected through blood. Nearly one-third of women were of the opinion that by using condom correctly during each sexual intercourse and having sex with one uninfected partner can prevent HIV/AIDS. The differences in the preventing HIV/AIDs were found by residence, age at consummation of marriage, education of women and husband. The misconception about transmission of HIV/AIDS from mosquito, flea or bedbug was reported by 9 percent of women. The other misconception was sharing food (3.5%), stepping on someone's urine/stool (4.7%), sharing clothes (3%), hugging and shaking hand (2.2%) respectively.

The women who had heard about HIV/AIDS were asked the place to test the HIV/AIDS (Table 6.11). More than two-fifth of the women know the place where the HIV/AIDS could be tested. The differences in the place of test were found by residence, age at consummation of marriage, education of women and husband. Forty three percent of women reported government hospital/dispensary and 46 percent reported private hospital/clinic as a place where people can go to test HIV/AIDS. The women who have heard about HIV/AIDS were asked if they had gone for the test. Thirteen percent of women had undergone for the test of HIV/AIDS. Among the women who had undergone a test 28 percent had undergone test less than 12 month ago (Table 6.12).

10. PERSONAL HABITS

Personal habits of adults (age 15 and above) such as consumption or abuse of tobacco and alcohol, and eating unhealthy foods are usually viewed from the lens of risk-taking behaviour due to their adverse health outcomes. The emerging morbidity pattern from the personal habits is a crucial predictor of current as well as future health status of a population. It has

become increasingly important to understand and examine the impact, these habits have on overall health status in India in the context of the epidemiologic and demographic transitions. Besides, the treatment seeking behaviours for these illnesses reflects the availability, accessibility, as well as quality of health care services. Studies have shown evidences of correlation between the shift towards non-communicable diseases (NCD) and increasing risk-taking behaviours among adult individuals. For instance, excessive drinking is linked to acute and chronic physical health problems, particularly those related to the heart, blood circulation, respiratory, diabetes, mental health, cancer, crime and disorder, domestic violence, unprotected sex, unintended pregnancy, etc., (Room, Baboor, and Rehm, (2005). Alcohol consumption contributes to many diseases and is now the fifth leading risk-factor for the global disease (Lim, Vos, Flaxman, et al, 2012). Also, the economic burden of these NCD is equally serious - i.e., a 10 percent rise in NCDs is found associated with 1 percent lower rates of annual economic growth. However, programmes to combat NCDs were tremendously underfunded, and a low priority policy, as it is not part of the millennium development goals (MDG).

The WHO has recently stated that NCD such as cancer, diabetes, and hypertension are largest causes of death, and by 2020 cardiovascular diseases will be the largest cause of death and disability, including developing countries like India (WHO 2010). In 2012, the UN conference on sustainable development (Rio+20), referred to non-communicable diseases as “one of the major challenges for sustainable development in the 21st century”, emphasising the fundamental link between health and development. In the same year, the World Health Assembly endorsed an important new health goal: to reduce avoidable mortality from non-communicable diseases (NCDs) by 25% by 2025 (the 25 by 25 goal). The future threat to health is from NCDs, as the world also urbanizes faster than before.

Since 1990s India’s overall health status has shown tremendous improvement, which signals a change and shift in pattern of morbidity and causes of death to non-communicable diseases (NCD), despite still substantial contribution of communicable diseases. The NCD accounted for 42 percent of all deaths in India (56% in urban areas and 40% in rural areas), as compared to communicable diseases with 38 percent (RGI, 2003). Estimated prevalence of diabetes, hypertension, ischemic heart diseases (IHD) and stroke is 62.5, 159.5, 37.0 and 1.54 per 1000 respectively. In the National Health Policy (NHP), the Government of India (GOI) has committed to eradicating infectious illnesses and reducing the mortality associated with such illness (MOHFW, 2002). One of the goals of the NHP 2002 is a 50 percent reduction of deaths from TB, malaria, and other vector and water borne diseases by the year 2010.

This chapter presents findings on the personal risk-taking habits, acute and chronic (infectious and non-communicable) diseases, and their treatment-seeking behaviours.

10.1 Tobacco and Alcohol Use in India

Tobacco and alcohol use have been associated with a wide range of major diseases, including several types of cancers and heart and lung diseases. Studies have shown that in addition to sharing the same health risks as men, women who use tobacco or alcohol also experience difficulty in becoming pregnant, are at an increased risk of infertility, pregnancy

complications, premature births, low-birth-weight infants, stillbirths, and infant deaths (USDHHS, 2004).

In India, information about tobacco and alcohol use among adults has been collected by various household surveys such as the National Sample Survey (NSSO) (50th round, 1998), NFHS (1992-93, 1998-99, and 2005-06), DLHS (2007-08), the Global Adult Tobacco Survey-India (GATS-India, 2009-10), etc., each survey with specific objectives and methodology. According to GATS India, 35 percent of adults in India age 15 and over use tobacco in some form or the other, with higher use among adults in most North eastern region (39-67%), east (36-50%), and central (40-53%) (IIPS & MoH&FW, 2010).

In India, there are varieties of tobacco products and its use is also very diverse. The most common ways of tobacco use are the smoking and oral (smokeless) variety. Dominant among the smoking form include cigarettes and bidis, while in case of the oral use of smokeless tobacco, chewing or applying to the teeth or gums (scented/unscented, with paan) are the popular forms, which has also become very popular in most parts of the country. The DLHS-4 also collects information related to tobacco and alcohol usage directly from among the eligible adults (women age 15-49 and men age 15-54).

In case of alcohol consumption, household surveys in India show that alcohol use among adults, both men and women, is not uncommon, but the use is found much lesser than tobacco use. Alcohol consumption is higher among men than females. Study in India indicated the prevalence of current use of alcohol ranged from about 7 percent in Gujarat (state officially under prohibition) to a very high 75 percent in Arunachal Pradesh, and its consumption among women exceeded 5 percent only in the Northeastern region. DLHS-4 information on alcohol use by adult men and women comes from a substantial number of respondents (40,830 men and 46,415 women).

10.2 Tobacco Use in Haryana

As shown in Table 7.1, overall 16 percent of adults in Haryana use any kind of tobacco in one way or the other. However, tobacco use varies across the state by age, residence, education, region, etc. The survey clearly indicates that tobacco use is highest and more likely among men (29%), older persons age 40 plus (over 20%), non literates and people with less than 5 years of education (18-24%), rural residents (18%), and among schedule caste (18%), etc.

In Haryana, the adults are using more of the smoking form (14%) as compared to the oral form (smokeless variety) of tobacco (3%). Use of smoke tobacco is higher among men (27%) as compared with females (2%), in rural areas (16%) and also more likely to be higher among the older adults age 40 and above (19-22%), and those with less than 5 years of education (22%), and also among the scheduled castes (17%).

In general, it is observed that in Haryana use of tobacco among adults increases with age, but in contrast, declines with increase in educational status. The pattern of using tobacco among adults also shows an interesting scenario across the districts in Haryana. Of the 21 districts in the state, two districts, namely Karnal and Kurukshetra stand out as lower use of tobacco in the state, but it is highest in Fatehabad and Yamunanagar (about 6% each), followed by Ambala and Sirsa (5% each) in the state. In case of smoking form of tobacco the use among

adults ranges from 9 percent in Fatehabad and Yamunanagar to 23 percent in Bhiwani (Table 7.4). Other districts in which at least 15-20 percent of adults are likely to smoke are Kaithal, Panipat, Jind, Hisar, Jhajjar, Mahendragarh, Gurgaon, Mewat and Palwal.

The use of tobacco (all forms) among men is not substantially high in Haryana – 5 percent for oral or smokeless and 27 percent for smoking. It is interesting to note that both forms of tobacco use is the lowest among teenagers (1% for smokeless and 3% for smoking), but increases sharply from age 20 onwards (among the youth) to older ages. Smoking is more common among men in rural areas (30%) than urban males (22%). Among men also, age and education emerge as important factors. The older males say age 45 and above are more likely (6% for smokeless and 38% for smoking) to use tobacco products than those aged less than 20 (1% for smokeless and 3% for smoking). Similarly, as education level increases use of tobacco in any form is more likely to diminish among men. The more educated males are nearly two to three times less likely to use tobacco than their counterparts who are illiterate (Table 7.2).

In Haryana, strictly speaking, smoking form of tobacco is used widely by men (about 27%) than oral or smokeless form (5%). Around 2 percent of adult men use tobacco with paan, while 3 percent use other forms of tobacco. About 19 percent of men are usual smokers (smoke at least once a day) in Haryana. The proportion of usual smokers is 22 percent in rural areas as compared with 15 percent in urban areas (Table 7.6).

Generally, use of tobacco is found to be very less among women, more so when compared with men. However, in Haryana (Table 7.1), a small proportion of adult women (2%) reported using any kind of tobacco. Among the women tobacco users, while only about 2 percent smoke, a very small proportion of them (below 1%) use the oral form or chew tobacco (Table 7.3).

The pattern of tobacco use observed among women is similar to that found among men. For instance, majority of women tobacco users prefer the smoking form and they belong to rural areas (3%), as compared with urban women (about 1%). As presented in Tables 7.3, women tobacco users are mostly to be over age 30 and those with less education. Clearly, age and education play an important role in influencing such personal habits. Among those women who use non-smoke form/chew tobacco, below 1 percent use it with betel nut or paan (Table 7.5). Among women who smoke, just about 1 percent are usual smokers (smoke at least once a day), which is found to be higher in rural areas (Table 7.6).

10.3 Use of Alcohol in Haryana

Household surveys in India show that alcohol use among adults, both men and women, is not uncommon, but the use is found much lesser than tobacco use. Alcohol consumption is higher among men than women. Study in India indicated the prevalence of current use of alcohol ranged from about 7 percent in Gujarat (state officially under prohibition) to a very high 75 percent in Arunachal Pradesh, and its consumption among women exceeded 5 percent only in the Northeastern region. DLHS-4 information on alcohol use by adult men and women comes from a substantial number of respondents (40,830 men and 46,415 women).

As presented in Table 7.1, in Haryana 10 percent of adults consume alcohol. In the state, the level of consumption is found much higher among adults age above 30 (13-16%), in rural areas (11%), with less than 5 years of education (14%), and highest among scheduled castes (12%). The proportion of men consuming alcohol is much higher (20%) as compared with women (below 1%). Unlike use of tobacco, education does not make much impact as an important factor. Undoubtedly, use of alcohol is higher among adults with lesser education, as compared to the more educated persons but the proportions do not differ drastically. The level of alcohol consumption by religious affiliation shows that the least consumption is among Jains (3%) and highest among 'Others' (18%).

In Haryana, alcohol consumption across the districts shows that of the 21 districts, only in 10 districts the level is less than 10 percent (Table 7.4). The prevalence of alcohol use across the state ranges from 5 percent in Mewat to about 19 percent in Gurgaon. Consumption of alcohol is found high in districts such as Bhiwani (14%), followed by Panchukala, Jind, Jhajjar, Faridabad and Kaithal (around 13% each), Sirsa (12%), Ambala (11%) and Hisar and Rohtak (about 10% each). Districts with less than 10 percent of adults consuming alcohol are Yamunanagar, Kurukshetra, Karnal, Panipat, Sonapat, Fatehabad, Mahendragarh, Rewari, Mewat and Palwal.

In Haryana, consumption of alcohol is found more concentrated among males (20%), much higher than among females (below 1%). Men who are more likely to consume alcohol are those in their 30's and 40's (around 25%), non-literates (27%), who follow 'Other' religions (28%) and scheduled castes (22%). The reporting of consumption of alcohol is seen among the teenagers (2%). It is interesting to note that more or less equal proportion of men in both rural and urban areas consume alcohol (around 20%).

Only about 1 percent of adult females reported consuming alcohol in Haryana (Table 7.3). The consumption of alcohol increases by age, with higher intake among older females age 45 and above (0.8%). A very small proportion of adult women (0.2%) reported as being a usual drinker.

11. MORBIDITY STATUS

In DLHS-4, for the first time, information on morbidity status of the household members was collected from the household respondent. The main objective is to get a somewhat fair idea about the prevalence of both acute illnesses (suffered for a week) and chronic illnesses (for a month or more), including disability (current) and injury (in last one year), suffered by any household member prior to the survey. Respondents were asked about occurrences of such illnesses among the household members, and to name the illness, including those diagnosed. Further, in case of occurrence of any disability, injury or illness, respondents were also asked about the nature of care sought, the type and place of health facility where treatment was done.

Depending on the nature and duration, all the illnesses or diseases are classified as (a) acute, and (b) chronic. Acute illness refers to those that occur suddenly with severe symptoms for short period during the last 15 days prior to the survey. Example includes diarrhoea, dysentery, acute respiratory tract infection (ARI), jaundice with fever, fever with

chill/rigors/malaria, fever with rash, reproductive tract infections (RTI), etc. In case of chronic illness, those symptoms that persist for longer than one month in the past one year prior to the survey. The list provided includes both symptoms and associated diseases categories.

11.1 Disability and Injury

From each of the selected household, DLHS-4 collected information from the head of the household or adult respondent on any injury and on five specific disabilities that household members may have suffered from such as mental, visual, hearing, speech, and locomotor. As it is difficult to capture the type of injury and its severity from lay reporting, assessment is made indirectly from the type and duration of hospitalization required for the injury.

As presented in Table 7.8, in Haryana about 2 percent of the sample population reported suffering from any injury. The prevalence of any injury is a little higher in the rural areas (1.9%) compared to urban areas (1.4%). The prevalence of any injury is observed to be higher in males (1.8%) as compared with females (1.3%) in the state.

About 4 percent of the injuries reported were treated in intensive care. However, 13 percent of injuries were treated as in-patient with stay for less than a week, and 9 percent reported they treated as in-patient with stay for more than 2 weeks. Interestingly, in Haryana, about 67 percent of injuries were treated using other form of treatments, i.e. other than intensive care or staying/in-patient, such as out-patient, traditional healers, or home remedies. More of females go for other treatments (68%) as compared with males. There is not much variation observed in terms of treatment of any injury by residence in Haryana.

In Haryana, among the five disabilities, the prevalence of visual disability is a little higher (0.3%) as compared to other disabilities. Mental, Speech and hearing disabilities are the other disabilities reported in Haryana (0.2%, 0.1% and 0.1% respectively). The prevalence of all the disabilities is more or less similar between men and women. No variation is observed in all the disabilities between the rural and urban areas (Table 7.9).

11.2 Reported Illnesses: Acute and Chronic

In order to assess the prevalence of illnesses from the selected household level in DLHS-4, the household respondents were first asked if any member of their households had suffered from any illness in the past one month or year. If reported that someone had suffered, more detail of the illness recorded, including main source of treatment. As mentioned earlier, all the illnesses are classified into (a) acute and (b) chronic, based on the nature and duration, and the information is collected from head or any adult member of the household.

Acute Illnesses

The prevalence of acute illness at the household level in Haryana is 13 percent. The differential in the prevalence of acute illness by residence shows little variation, with a higher rate in the rural areas (13.4 against 12.5 in urban areas).

About 13 percent of household members reported suffering from any acute illness in Haryana, and more of women (14%) than men (13%) reported to have suffered from any acute illness. Among the prevailing acute illnesses, fever (other than those with rash or

jaundice) is reported by nearly 38 percent, followed by acute respiratory tract infection (ARTI) (27%), malaria (13%), diarrhoea/dysentery (4%) and fever with rash (3%). Interestingly, more men are suffered from acute respiratory tract infection (ARTI) than women, whereas a higher proportion of women (39%) reported as being suffered with other type of fever than men (37%). Prevalence of acute respiratory tract infection (ARTI) is found higher in urban areas, whereas malaria and other type of fever is found to be higher in rural areas.

Nearly everyone who had suffered from any acute illness sought treatment. Among those who had sought treatment, 80 percent preferred treatment at private facility, mainly in a clinic/dispensary (61%), followed by hospital (19%). About 10 percent of those who had acute illnesses got treated in a government facility, mainly in a hospital (7%). About 3 percent with any acute illnesses were treated at DOTS centre or at home. In Haryana, use of private health facility for treatment of acute illness is quite common even in rural areas (81%), and more or less equally accessed by both males and females.

Chronic Illnesses

Survey results of chronic illnesses described pertain to prevalence, type, and source of treatment by sex and residence. In Haryana about 15 percent of the households reported a member suffering from chronic illnesses that lasted for over a month in the past one year prior to the survey (Table 7.8). As shown in Table 7.13, reporting by symptoms of chronic illnesses suffered by household members is highest for diseases of the musculoskeletal system (24%), followed by diseases of respiratory system (10%) and gastrointestinal system (7%). Diseases related to cardiovascular system, central nervous system and skin account for about 5 percent respectively. Interestingly, reporting of symptoms of chronic diseases other than the twelve identified diseases account for 32 percent.

In Haryana, not much differences observed in the reporting of symptoms of chronic diseases between males and females, except in case of some diseases. For instance, more males reported symptoms related to respiratory system (12% as compared with 8% among females), cardiovascular system (7% versus 4% by females) and skin diseases (6% against 4% among females). In contrast, females reported more of symptoms related to disease of musculoskeletal system (28% compared to 18% among males).

By and large, most chronic illnesses show more or less similar prevalence in both rural and urban areas. However, some of these chronic illnesses show slightly higher prevalence either in rural or urban areas. For instance, urban residents reported more of diseases of cardiovascular system (6%) and 'others' (39%) than rural residents. In case of rural areas, much higher reporting related to diseases of respiratory system (10%), musculoskeletal system (25%), gastrointestinal system (8%), and skin (6%) is observed.

Household respondents were also asked about the nature and source of treatment for chronic illnesses suffered by any of their household member. In Haryana, only 55 percent of those who suffered from chronic illnesses have details of diagnosis or treatment. About one-third has no details of diagnosis or treatment, and about 14 percent do not sought treatment at all. The proportion not seeking treatment (16%) or with no details of treatment (33%) is more in

the rural areas as compared to urban areas (12% and 29% respectively). Overall, 51 percent of rural residents and 61 percent of urban residents have details of diagnosis or treatment for the chronic illnesses. It is also observed that a higher proportion of males (57%) have details of diagnosis or treatment than females (53%).

Interestingly, in Haryana most people who suffered from chronic illnesses sought treatment at private facility (78%), which is observed to be equally accessible for both urban and rural residents. About 19 percent were treated at government facility, while 1 percent reported being treated at home, and 2 percent sought other form of treatment.

Persons who sought treatment for chronic illnesses were also asked about the details of the diagnoses at the facility. In Haryana, hypertension (12%) and diabetes (8%) are the most commonly diagnosed chronic illnesses, followed by diseases related to heart and asthma or chronic respiratory failure (around 4% each). Goitre accounts for about 1 percent of the diagnosed chronic illnesses, and about 1 percent with tuberculosis (TB). As expected, the proportion diagnosed with these chronic illnesses is much higher in urban areas, particularly hypertension and diabetes. The results show that more females suffered from hypertension (14% against 10% among males), while men are more suffered from diabetes (10% against 6% among females), diseases related to heart (6% against 3% among females), asthma or chronic respiratory failure (4% against 3% among females) and tuberculosis (2% against 1%).

Contrast to situation in the general population, among the older persons age 60 and above the prevalence of most chronic illnesses is much higher. For instance, about 14 percent of older persons were diagnosed with hypertension, 11 percent with diabetes, and about 6 percent each with diseases related to heart and asthma or chronic respiratory failure (Table 7.15). The prevalence of some of these chronic illnesses indicates that higher proportion of older persons in urban areas suffered from hypertension (19% as compared with 12% in rural areas), diabetes (19% against 7% in rural areas) and diseases related to heart (7% against 6%), while in rural areas a higher proportion older persons reported as being suffered from asthma or chronic respiratory failure (7% as compared with 4% in urban areas) and tuberculosis (2% against 1%). Similar to the situation in the general population, among the older persons also it is found that more females are diagnosed with hypertension (16% as compared with 13% among males). More of male older persons are diagnosed with diabetes, diseases related to heart, asthma or chronic respiratory failure, TB and stroke. The proportion of older persons diagnosed with these chronic illnesses is much higher in urban areas, particularly hypertension and diabetes.

11.3 Tuberculosis (TB)

Tuberculosis has re-emerged as a major public health problem in many parts of the world, often as a concomitant illness to HIV/AIDS. Tuberculosis, once known as the ‘White Plague’, is contagious and spreads through droplets that can travel through the air when a person with the infection coughs, talks, or sneezes. Today, TB is a leading cause of death among people who are HIV-positive. Worldwide, an estimated one-third of the nearly 40 million people living with HIV/AIDS are co-infected with TB. In most developing countries, TB would continue to be a serious health threat even in the absence of HIV/AIDS due to the

public health challenges posed by poverty, high illiteracy, and poor sanitation. The GOI has stated that ‘In 2005, a total of 97 percent population was covered under the Revised National Tuberculosis Programme.’ The government allocated Rs. 680 crores for the National Tuberculosis Control Programme (NTCP) in the 10th Plan (DGHS and WHO, 2005).

In Haryana, about 1 percent of the household population diagnosed with TB, which is found higher among males and in rural areas.

12. NUTRITION AND HEALTH

The DLHS-4 collected data on the nutritional status of children by measuring the height and weight of all children under age five in the selected households. The nutritional status assessment helps to identify sub groups of child population that face increase risk of faltered growth and potential health risks and vulnerabilities. The nutritional status of children in the survey population is compared with WHO child growth standards, which are based on an international sample of ethnically, culturally and genetically diverse healthy children living under optimum condition that are conducive to achieving a Child’s full genetic growth potential (WHO, 2006)¹. These standards can therefore be used to assess nutritional status of children all over the world, regardless of ethnicity, social and economic influence and child feeding practices. Accordingly, three standard indices of physical growth that describes the nutritional status of children are height-for-age (stunting), weight-for-height (wasting) and weight-for-age (underweight). Each of these indices provides different information about growth and body composition that can be used to assess nutritional status.

In DLHS-4, all children listed in the household, who were born in year 2008 or later were eligible for measurement of their height and weight. Thus, height and weight measurements were collected even from those children whose mothers may not have been interviewed in the survey. For this purpose, all the survey team carried with them two scales and two height boards, which were standardized in all aspects and calibrated for accuracy. Recumbent length was recorded for children under age two years. Standing height was measured for all other children. Table 8.1 represents percentage of children below age five classified as malnourished according to three anthropometric indices of nutritional status (height for age, weight for height and weight for age) by some selected background characteristics. The analysis is based on information collected from 12153 children from Haryana for whom complete and erodible anthropometric and age data are available.

12.1 Height-for-Age (Stunting)

Height-for-age measures linear growth. A child who is more than two standard deviations below the median (-2SD) of the WHO reference population in terms of height-for-age is considered short for his or her age are stunted. This condition reflects the cumulative effect of chronic malnutrition. If a child is below three standard deviations (-3SD) from the reference median, he or she is considered to be severely stunted. In Haryana 32 percent children under age five are stunted and more than 15 percent are severely stunted. Variation in the

¹ World Health Organization (WHO) Multicentre Growth Reference Study Group. 2006. *WHO Child Growth Standards: Length/Height-for-Age, Weight-for-Length, Weight-for-Height and Body Mass Index-for-Age: Methods and Development*. Geneva, Switzerland: WHO.

prevalence of stunting by age group shows that stunting is highest (42%) in children age 19-24 months, followed by those in age 25-35 months (37%) and the lowest (12%) in children below age 6 months. Prevalence of severe stunting shows a similar pattern, with the height proportion of severe stunting in children age 19-24 months (30%), followed by among those age 25-35 months (19%). Sex differential in the prevalence of stunting is not pronounced as both male and female children are equally likely to be stunted (32% each). The sex differential remains by and large the same even in case of severe stunting. Children under age five living in rural areas and coming from schedule castes families are more likely to be stunted than others.

The prevalence of stunting is not uniform across different districts in Haryana. Stunting is the lowest in Mewat district (7%) followed by Karnal and Rewari (17% each). While, the prevalence of stunting is the highest in Kaithal (59%) followed by Ambala (48%). Severe stunting is the lowest in Mewat (3%), followed by Karnal and Panipat (9%). On the other hand, Kaithal portrays the highest prevalence even in case of severe stunting.

12.2 Weight-for-Height (Wasting)

Weight-for-height describes the current nutritional status. A child who is more than two standard deviations below (-2SD) the reference median for weight-for-height is considered to be too thin for his or her height, or wasted. This condition reflects acute or recent nutritional deficit. As with stunting, wasting is considered severe if the child is more than three standard deviations below the reference median. Overall 32 percent children in Haryana are wasted and 19 percent are severely wasted. Analysis by age group shows that wasting ranges from a minimum 29 percent in children age 19-24 months to the maximum 40 percent in children in age 0-6 months. Children residing in rural areas are more likely to be wasted (34%) than children living in urban areas (31%). Children from scheduled castes are more likely to be wasted (35%) than the children in other caste groups. Variations by district portray that wasting in children ranges from 15 percent in each of Mahendragarh to 46 percent in Karnal.

12.3 Weight-for-Age (Underweight)

Weight-for-age is a composite index of weight-for-height and height-for-age. Thus, it does not distinguish between acute malnutrition (wasting) and chronic malnutrition (stunting). A child can be underweight for his age because he or she is stunted, because he or she is wasted, or both.

Table 8.1 reveals that 36 percent of children under age 5 are underweight and 15 percent are severely underweight. The proportion of underweight children is the highest (40%) among children age 25-35 months and the lowest (27%) among children age 7-12 months. The sex differential in the proportion of underweight children is not so much pronounced. Rural children are more likely to be underweight (37%) than the urban children (35%). Children from scheduled tribes are relatively more likely to be underweight than other caste groups. By districts, proportion of underweight children ranges from 52 percent in Kaithal to 20 percent in Mewat.

12.4 Body Mass Index of Women

In many countries, chronic energy deficiency characterized by BMI of less than 18.5 among adults remains the predominant problem, leading to low productivity and reduced resistance to illness. Prevalence of overweight among women is also growing problem in developing countries. Overweight individuals are predisposed to a wide range of health problem including diabetes and heart diseases and also poor birth outcomes for pregnant women. The BMI is used to measure thinness or obesity. It is defined as weight in kilograms divided by height in meters squared (Kg/m²). A BMI of less than 18.5 is used to define thinness or acute under nutrition. A BMI of 25 or above usually indicates overweight and a BMI of 30 or above indicates obesity.

In DLHS-4, height and weight measurements in Haryana were obtained for 29,378 women age 15-49 years who were present in the sample households at the time of survey. Table 8.3 presents percentage of women age 15-49 by their BMI. The mean BMI is 22.5, which falls in the normal BMI classification. Around 59 percent of the women age 15-49 have a normal BMI, 22 percent are undernourished or thin (BMI less than 18.5) and 19 percent are overweight or obese (BMI 25 or higher). It is evident from the table that there is profound variation in BMI by some selected background characteristics of the women. The women age 15-19 are more likely to be thin or undernourished (44%) than women in other age cohorts. Rural women are more likely to be thin or undernourished (25%) than their urban counterpart (17%), whereas urban women are more likely to be overweight or obese as compared to rural women (25% and 16% respectively). Educational attainment doesn't show any consistent relationship with the proportion of thin or undernourished women. Among women who are non literate, nearly one fifth of them (21%) are thin or underweight and 18 percent are overweight or obese. The percentage of overweight or obese is highest among women having more than 10 years of schooling. The women from scheduled caste households, having larger potential to have food insecurity, are comparatively more likely to be thin in comparison to those households from rest caste-groups. Proportion of the women who are thin or underweight is not uniform across districts of Haryana. It ranges from the minimum of 13 percent in Kurukshetra and Faridabad to 29 percent in Hisar. On the other hand, proportion of ever married women who are overweight or obese is the highest in Sonapat (27%) and lowest in Mewat.

12.5 Prevalence of Anaemia

Anaemia, characterized by a low level of hemoglobin in the blood, is major health problem in developing countries, especially among young children and pregnant women. Anaemia among pregnant women may be an underlying cause of maternal mortality, spontaneous abortion, premature births, and low birth weight. The most common cause of anaemia is inadequate dietary intake of nutrients necessary for synthesis of hemoglobin, such as iron, folic acid, and vitamin B12. Anaemia also results from sickle cell disease, malaria, and parasitic infections (Benoist et al. 2008)². It is against this background, a number of

² Benoist, B. D., E. McLean, I. Egli, I., and M. Cogswell (eds.). 2008. *Worldwide Prevalence of Anaemia 1993–2005: WHO Global Database on Anaemia*. Geneva, Switzerland: World Health Organization

interventions have been put in place to address anaemia in children in developing countries. These include expanded distribution of iron supplements and deworming medication to children age 1-5 every six months.

In DLHS-4, all the usual residents of the selected households including children age 6-59 months were included in the anaemia testing, where blood drops were collected using dried blood spot (DBS) method and tested in designated laboratories. The process of blood collection consists of obtaining blood droplets by pricking in the middle or ring finger with a retractable and non-reusable lancet. Before pricking, the finger was cleaned with a swab containing 70 percent isopropyl alcohol and allowed to dry. In case of those children where blood droplets were not possible from middle or ring finger, heel pricking was practiced and DBS were prepared.

Table 8.5 shows the anaemia status of children age 6-59 months by some selected background characteristics. Over three-fifths (63%) of children age 6-59 months suffer from some level of anaemia (Hb <11.0g/dl), 16 percent of children have mild anaemia and 38 percent have moderate anaemia (Hb 7.0-9.9g/dl). About nine percent of children age 6-59 months have severe anaemia (Hb <7.0 g/dl). There is no differential in prevalence of anaemia among children age 6-59 months by sex of child and place of residence. The prevalence any anaemia does not vary significantly by caste of the household to which children belong to. Of course, Sikh's children are comparatively less likely to suffer from any anaemia than those from other religion.

The prevalence of any anaemia declines sharply among school going population age 6-19 years (56%). The proportions of school going population age 6-19 years who suffer from mild and moderate anaemia are 17 and 33 percent respectively. The pattern in decline in any anaemia with increasing age is linear in nature with the maximum (58%) among those in the age-group 6 to 10 years and minimum (53%) in those age 17-19 years. Female children and those living in rural areas are more likely to be anaemic (Table 8.6). The prevalence in anaemia also declining linearly with increasing years of schooling, from 59 percent among non-literate to 52 percent among those having 10 or more years of schooling. Scheduled castes are also more likely to be anaemic even in the schooling going population age 6-19 years.

Prevalence of anaemia declines further in case of adult population age 20 years and above. It is evident from Table 8.7 that over fifty percent (53%) of adult age 20 years and above are anaemic in Haryana. Adult women are approximate 1.2 times more likely to be anaemic than their male counterparts. Likewise to the school age population (age 6-19), years adults population portrays a decreasing prevalence of anaemia with increasing age groups. There is no difference in the prevalence of anaemia by place of residence (Table 8.7). Increasing years of schooling shows a linear decline in the prevalence of anaemia but the pattern gets changed in case of males and females where prevalence of anaemia remains by and large the same (47% to 50%) among males and (56% to 59%) females respectively across the different years of schooling. Islam religion portrays a distinct pattern with relatively higher prevalence of anaemia even among adult age 20 years and above, which may have definite implication for the food security scheme in the state.

Prevalence of anaemia among pregnant women poses much severe health consequences and may be an underlying course of maternal mortality, spontaneous abortion, premature births and low birth weight. Table 8.9 presents the percent of pregnant of women age 15-49 classified as having iron-deficiency (anaemia) by degree of anaemia and some selected background characteristics.

It is evident from the table that around three-fifths (60%) of pregnant women in Haryana are anaemic. About seventeen percent of them have mild anaemia (10.0-10.9 g/dl), 36 percent have moderate anaemia and 7 percent have severe anaemia. Pregnant women in Haryana who are younger in age (specifically age 15-29), those living in rural areas, and coming from other backward castes households are more likely to be anaemic.

12.6 Prevalence of Diabetics

Diabetics has serious consequences for individuals and poses a large burden on health services, especially in developing countries. According to the International Diabetics Federation (IDF), diabetics poses a daunting challenge to the sustainable development of the nation, as almost every tenth adult in India is estimated to be affected by either diabetics or pre-diabetics (IDF 2011). The latest global figures on diabetics, released by the International Diabetics Federation (IDF), has raised a serious alarm for India by saying that nearly 52% of Indians aren't aware that they are suffering from high blood sugar (IDF, 2011)³. In DLHS-4, women and men age 18 and older in the selected households were eligible to have their blood glucose level tested. The blood glucose was measured using portable glucometer namely SD code free, where blood droplets were obtained by pricking in the middle or ring finger with a retractable and non-reusable lancet. Before pricking, the finger was cleaned with a swab containing 70 percent isopropyl alcohol and allowed to dry. In the process, the first two drops of blood were wiped away and third drop was drawn into the glucose strips.

Table 8.10 and 8.12 present data on random blood glucose values for men and women age 18 and above from the sample households included in DLHS-4. Data shows that 6 percent of men and women age 18 and above in Haryana suffer from diabetics as the level of blood glucose among those have been 160mg/dL or higher. Another 9 percent of men and women age 18 and above in Haryana are pre-diabetic. However, over four-fifth of men as well as women have normal level or even lower level of blood glucose.

Prevalence of diabetics increases linearly with increasing age among men as well as among women age 18 years and above. Men age 60 & above are over 8 times more likely to suffer with diabetics as compared to those in the age-group 18-29 years. The pattern remains by and large same even among women age 18 years and above - 1.8 percent in the age group 18-29 years and 13.3 percent in age 60 years & above (Table 8.12). Men and women age 18 and above who reside in urban areas are more likely to suffer from diabetics than their rural counterparts (1.4 times). Persons who have less than 5 year of schooling are more likely to suffer from diabetics than their counter parts. Level of diabetics prevalence cuts across religion group, which may have implication for the differences in life style and food habits.

³ International Diabetics Federation (IDF). 2011. *Diabetics Atlas, 5th edition*. Brussels, Belgium: IDF

Adult men and women in Muslim religion are very less likely to suffer from diabetes than the other religion categories. Though cast differentials in prevalence of diabetes is not profound but men and women who are non SC/ST and non OBC are more likely to suffer from diabetes than others, which may be primarily due to changes in their life styles and dietary practices.

Tables 8.11 and 8.13 present variation in the prevalence of diabetes among adult men and women age 18 and above across different districts of Haryana. Among districts, men in Sirsa, Bhiwani, Mahendragarh and Palwal have the highest prevalence of diabetes (9% each) followed by Sonapat, Fatehabad, Hisar, Rohtak (8%) and Panipat, Jhajjar and Faridabad, (6% each). On the other hand, men in Karnal (3%) have relatively lower prevalence of diabetes among different districts of Haryana. The pattern remains by and large the same even if we analyze the prevalence of diabetes among adult women in different districts of Haryana. The prevalence is the highest among adult women in Fatehabad, Sirsa and Palwal (8%) and lowest in Kaithal, Rewari and Mewat (4% each).

12.7 Prevalence of Hypertension

Blood pressure rises and falls throughout the day. When blood pressure stays elevated over time. It is called high blood pressure. The medical term for high blood pressure is hypertension. Raised or high blood pressure acts as one of the contributing and intermediate risk factors for developing coronary heart disease, stroke, and kidney disease. The measurements taken for blood pressure in DLHS-4 were not intended to provide a medical diagnosis of the disease but rather to provide a cross-sectional assessment of the prevalence of high blood pressure in the population at the time of the survey. Although the results of the blood pressure measurements are regarded only as a statistical description of the survey population, they provide insight into the size and characteristics of the population at risk for hypertension. The DLHS-4 is used Ross Max AW150 blood pressure monitor model; the automatic device included separate cuffs for measuring blood pressure in respondents with small, medium and large arm circumferences. Interviewers were adequately trained to use this device according to the recommended protocol. Two health investigators were included in each team for data collection.

Two measurements of both systolic and diastolic blood pressure were taken during the survey at approximately ten minutes interval and the average measurement was used to report respondent's blood pressure values. Tables 8.14 and 8.16 present the information on blood pressure values for men and women age 18 years and above by some selected background characteristics. In the table the blood pressure level has been defined into six categories depending upon various combinations of systolic blood pressure (SBP) and diastolic blood pressure (DBP). The value of SBP greater than 140 mmHg or DBP greater than 90 mmHg is defined as hypertensive with elevated blood pressure, which may have implications for need for medication on a priority basis (AHA, 2003)⁴. In DLHS-4 we have taken SBP 130-139 or DBP 85-89 as the pre-hypertension.

⁴ American Heart Association. <http://www.heart.org/HEARTORG/>.

It is evident from Tables 8.14 and 8.16 that 15 percent of men and 11 percent of women age 18 years and above in Haryana are in the stage of pre-hypertension, while 28 percent men and 21 percent of women age 18 years and above are in the stage of hypertension and require medical attention on a priority basis. A relatively larger proportion of men as well as women age 18 years and above living in urban areas are found to be hypertensive (30% and 23%) than those living in rural areas (27% and 20% respectively). The pattern is by and large the same even in case of the pre-hypertension though the magnitude of difference reduces considerably. The pattern in prevalence of pre-hypertension and hypertension across different districts of Haryana are not uniform. Among men age 18 years and above, prevalence of pre-hypertension ranges from a minimum in Hisar (10%) to the maximum in Rohtak (20%).

In case of hypertension, the prevalence ranges from a minimum in Hisar (19%) to the maximum in Mahendragarh (39%) and Faridabad (36%). In case of women age 18 years and above, the prevalence of pre-hypertension is the lowest in Hisar (6%) among the 21 districts of Haryana. On the other hand, Kurukshetra (16%), Rewari (15%) and Rohtak (14%) are some of the leading districts having higher prevalence of pre-hypertension among women age 18 years and above. District wise variation in the proportion of women age 18 years and above suffering with hypertension ($SBP \geq 140$ or $DBP \geq 90$) also portrays the same pattern with the lowest proportion of women in Panipat and Hisar (16% each) the highest proportion in Faridabad (28%), Mahendragarh (27%) and Ambala and Jind (26% each).

12.8 Use of Iodized Salt

Salt used in the household is the most common vehicle for iodine fortification to prevent the public health concerns of iodine deficiency disorders. The compound used for fortification of salt is potassium iodide (KIO₃). According to the World Health Organization, a country's salt iodization program is considered to be on a good track to eliminate iodine deficiency when 90 percent of households use iodized salt. The DLHS-4 made an effort to assess household iodized salt consumption by testing iodine contents in the salt being used by the household. Table 8.18 shows the proportion of households using iodized salt according to some selected background characteristics.

Over all, salt was tested for iodine contain in 85 percent of household in Haryana and 56 percent households were found to use salt with adequate iodine contain. Another 24 percent households were found to use salt with iodine but the proportion of iodine contain was not adequate. There is no significant difference in use of iodine salt by place of residence (Table 8.18). Analyzing the variation in proportion of household using iodized salt by districts; it is evident from Table 8.19 that it ranges from a maximum in Jind (79%) to the minimum in Panipat (48%).

13. HEALTH FACILITIES

The basic objective of the population linked facility survey conducted in DLHS-4 is to collect data on health personnel, availability of drugs/medicines, equipments, basic RCH care amenities, communication means and infrastructure at the level of, PHC and CHC, in order to assess the adequacy of RCH services in rural areas.

In DLHS-4 facility survey, at the district level, all Community Health Centres (CHCs), Sub-Divisional Hospital (SDH) and the District Hospitals (DH) were covered. All Sub-Health Centres and Primary Health Centres (PHCs) which were expected to serve the sampled population of selected PSU were also covered.

In Haryana, the average sampled rural population served per Sub-Health Centre, PHC and CHC are 8,239, 46,503 and 1,56,701 respectively (Table 9.1). In total, villages were surveyed in DLHS-4 and the RCH services of these sampled villages were catered by 673 Sub-Health Centres, 246 PHCs and 106 CHCs.

Out of the total 673 SHCs, 388 Sub-Health Centers functioning in government building, 24.2 percent have regular electricity (Table 9.2). Forty percent of these Sub-Health Centres are having labour rooms and out of this 82.5 percent are currently in use. Toilet facility is available in 92.3 percent of the sampled Sub-Health Centre located in government buildings. More than 92 percent of these Sub-Health Centres running in government buildings have provision for water supply.

Citizen's charters are displayed in 85.1 percent of the sampled 673 Sub-Health Centres (Table 9.3). The proportion of sampled Sub-Health Centre facilitated by Village Health & Sanitation Committee (VHSC) and those that received untied funds is 89.2 percent and 88.5 percent respectively.

In Haryana, more than 90 percent of all the Sub-Health Centers have Auxiliary-Nurse-Mid-Wife (ANM) in position and additional ANM available in 83.5 percent of the SHCs. Less than 20 percent of the SHCs are having Male Health Worker (MHW) in the districts of Kurukshetra, Palwal and Ambala. As compared to other districts in Rohatak district 100 percent of the SHCs are with Male health Worker in position at the time of the survey (Table 9.4).

In Haryana, out of 246 sampled PHCs, 81 percent of the PHCs have Medical Officers. The state as a whole, the availability of other human resources like Lady Medical Officers, AYUSH Doctors, and Pharmacists in position turned out to be about 34.2 percent, 19.1 percent and 81.7 percent of the sampled PHCs respectively.

At the PHC level, all the districts, except Jind in Haryana have more than 45 percent of the PHCs are having Medical Officers (MOs) in position. In the following five districts namely Kurukshetra, Sirsa, Rewari, Faridabad and Mewat are having Medical Officers in Position at PHCs during the survey (Table 9.5).

Out of 246 sampled PHCs around 48 percent of the have residential quarters available for Medical Officer. Around 80 percent of the sampled PHCs are functioning on a 24 hour basis. About 76 percent of the sampled PHCs catering to the sample villages have at least four beds. Two-fifths of the PHCs have regular power supply and only 31 percent have functional vehicles (Table 9.6).

Newborn care services are available in 91 percent of the sampled PHCs, 66 percent provide referral services for delivery case, and 74 percent have conducted at least 10 deliveries (Table 9.7).

Ninety six percent of sampled PHCs have received 'Untied Fund' and almost all the sampled PHCs (99%) have utilized the funds (Table 9.8). Rogi Kalyan Samiti (RKS) has been constituted in 94 percent and the Citizen's Charter displayed in 90 percent of sampled PHCs.

Out of 106 surveyed CHCs, only 14 CHCs are having an Obstetric Gynecologist in position, 7 CHCs having Pediatrician, 9 CHCs having Anesthetist and 12 PCHCs having Public Health Manager (Table 9.9).

For the state as a whole out of 106 CHCs only 8 CHCs have blood storage facility and 76 CHCs have designated as First Referral Units (FRUs). Out of the 106 CHCs around 49 and 97 CHCs are having functional Operation Theaters (OTs) and newborn care services respectively (Table 9.10).

Out of total 106 CHCs 95 CHCs have utilized untied funds, almost all CHCs have constituted RKS and monitored regularly and displayed citizen's charter in 98 CHCs (Table 9.11).

Total 21 Sub-Divisional Hospitals (SDHs) have surveyed in Haryana out of this only 6 SDHs are having pediatricians and only 2 SDHs are having radiographers in position. Only one Sub-Divisional Hospital namely Faridabad is having 2D echo facility. Ultra sound facilities are available in only 3 Sub-Divisional Hospitals, three phase connection is available in nineteen SDHs, critical care area is available in 9 Sub-Divisional Hospitals and suggestions and complaint box are available in all Sub-Divisional Hospitals.

In Haryana total 21 District Hospitals have surveyed out of this 20 district hospitals having pediatricians in position and eight of the District Hospitals are having radiographers. Only eight District Hospitals are having 2D echo facility and 19 District Hospitals are having ultra sound facilities. Three phase connection is available in all districts, critical care area is available only in 16 District Hospitals and suggestions and complaint box are available in all the District Hospitals.

BACKGROUND CHARACTERISTICS

TABLE 1.1 BASIC DEMOGRAPHIC INDICATORS

Basic demographic indicators of H and its districts, Census 2011, India.

State/Districts	Population (in thousands)	Percentage urban	Percentage decadal growth rate ¹	Sex ratio ²	Percentage literate 7+		
					Male	Female	Total
Panchukala	561.3	54.9	+19.83	873	87.0	76.0	81.9

TABLE 1.3 DISTANCE FROM THE NEAREST EDUCATIONAL FACILITY

Percent distribution of sampled villages by distance from the nearest educational facility, Haryana, 2012-13.

Educational facility	Within village	Distance from the village			Total percent (100%)
		< 5 km	5-9 km	10+ km	
Primary school	93.1	5.8	0.8	0.3	100.0
Middle school	83.6	12.3	3.1	1.0	100.0
Secondary school	67.8	21.5	9.0	1.7	100.0
Higher secondary school	50.4	27.7	14.7	7.2	100.0
College	9.7	11.4	28.0	50.8	100.0
Madarsa	10.6	12.3	21.1	55.9	100.0

Note: Distance from the village is calculated for only those villages which do not have the facility within the village. Table is based on unweighted cases.

TABLE 1.4(a) DISTANCE FROM THE NEAREST HEALTH FACILITY

Percent distribution of sampled villages by distance from the nearest health facility, Haryana, 2012-13.

Health facility	Within village	Distance from the village ¹			
		Within 3km	Within 5km	Within 10km	More than 10km
Sub-Health Centre	59.9	80.4	87.9	94.2	5.8
Primary Health Centre	22.7	41.0	60.2	87.3	12.7
Community Health Centre	6.4	17.1	28.4	56.2	43.8
District/Govt. Hospital	4.4	10.6	17.2	35.2	64.8
Government Dispensary	19.5	33.5	43.1	66.1	33.9
Private Clinic	47.3	59.0	66.1	84.6	15.4
Private Hospital	8.5	23.6	35.6	68.1	31.9
AYUSH Health Facility ²	7.2	23.4	31.9	57.2	42.8

¹ Including facilities within village.
² AYUSH-Ayurveda, Yoga and Naturopathy, Unani, Siddha and Homeopathy.

TABLE 1.4(b) PROGRAMMES BENEFICIARIES

Percentage villages having any beneficiaries from selected programs, Haryana, 2012-13

Programmes	Percentage of villages	Number of villages
Janani Suraksha Yojana (JSY)	94.1	666
Janani Shishu Suraksha Karyakram (JSSK)	85.6	606
Integrated Child Development Scheme (ICDS)	79.8	565
Total number of villages		708

TABLE 1.5 REASONS FOR DROPPING OUT OF SCHOOL

Percentage of household population aged 6 to 17 years who dropped out of school by main reasons, Haryana, 2012-13.

Reason	Total			Rural			Urban		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
School too far	4.6	8.1	6.4	4.6	9.2	7.1	4.7	5.5	5.0
Further education not necessary	2.5	5.1	3.8	2.8	6.3	4.7	1.8	2.3	2.0
Required for work in household activities/ farm family/business	7.1	10.4	8.8	6.5	10.6	8.7	8.2	10.0	9.1
Required for outside work	5.6	2.9	4.2	4.8	1.6	3.1	7.1	6.2	6.7
Not interested in studies	33.2	24.7	28.8	33.5	24.9	28.9	32.6	24.1	28.7
Cost too much	14.2	16.7	15.5	12.1	15.4	13.8	18.0	20.3	19.0
Repeated failures	1.9	1.6	1.7	2.7	1.4	2.0	0.3	2.0	1.1
Got married	0.4	4.2	2.3	0.0	4.7	2.6	1.2	2.7	1.9
Others	30.6	26.3	28.4	33.0	26.0	29.2	26.1	26.9	26.5

Number of persons**	800	817	1,617	474	547	1,021	326	270	596

** Unweighted cases.

TABLE 1.6a HOUSING CHARACTERISTICS AND HOUSEHOLD ASSETS

Percent of households by housing characteristics and household assets and goods by residence, Haryana, 2012-13.

Housing characteristics	Total	Residence	
		Rural	Urban
Electricity			
Having electricity	97.7	97.2	98.7
Source of drinking water			
Improved source ¹	99.1	98.9	99.4
Sanitation facility			
Improved sanitation ²	83.7	77.3	94.5
Fuel used for cooking			
Liquefied Petroleum Gas (LPG)	45.9	25.1	81.2
Electricity	0.2	0.2	0.3
Kerosene	0.4	0.3	0.5
Wood	23.4	31.4	10.0
Others	0.2	0.3	0.0
Type of house			
Kachha	6.7	8.9	3.1
Semi - pucca	23.8	29.7	13.8
Pucca	69.4	61.4	82.8
Number of rooms			
1	17.2	16.5	18.3
2	27.8	30.3	23.5
3+	55.1	53.2	58.3
Household assets			
Radio/transistor	3.3	3.3	3.3
Television	85.0	81.9	90.1
Computer/ laptops without internet	4.6	2.4	8.3
Computer/ laptops with internet	6.5	2.4	13.6
Telephone only	6.1	3.2	10.9
Mobile only	89.4	87.6	92.4
Washing Machine	40.9	31.6	56.5
Refrigerator	57.3	49.2	70.9
Sewing machine	61.5	60.9	62.4
Watch/ clock	86.9	85.8	88.9
Bicycle	41.7	44.4	37.0
Motor cycle/ scooter	40.5	35.1	49.6
Car / Jeep/van	10.4	5.4	18.9
Tractor	5.0	7.5	0.8
Water pump/tube well	4.9	5.9	3.2
Cart driven by animal	4.2	6.5	0.4
Cart driven by Machine	1.5	2.2	0.4
Other cart	1.0	1.0	0.9
Cooler/AC	46.2	38.3	59.6
Number of households**	33,772	19,216	14,556

¹ Includes piped into dwelling piped to yard/plot, public tap/stand pipe/hand pump./tube well/ bore well/well covered/spring tanker, cart with small tank and bottled water. ² includes flush to sewer/septic/twin pit, pit with slab, pit ventilated improved, other. ** Unweighted cases.

TABLE 1.6b HOUSING CHARACTERISTICS BY DISTRICT

Percentage of households with selected characteristics by districts, Haryana, 2012-13.

District	With electricity	Improved source of drinking water ¹	Improved access to Sanitation ²	Using Liquefied Petroleum Gas	Living in <i>pucca</i> house	Having BPL card
Panchukala	99.2	99.9	89.5	77.3	85.1	10.5
Ambala	99.6	100.0	84.9	62.0	69.6	19.8
Yamunanagar	98.9	99.9	73.9	49.7	72.6	17.7
Kurukshetra	99.8	100.0	91.6	59.1	60.9	22.8
kaithal	91.8	99.8	75.7	38.0	50.2	26.6
Karnal	99.7	99.8	83.4	53.0	57.6	23.5
Panipat	99.0	99.2	84.2	57.7	60.0	17.8
Sonipat	98.7	98.4	82.2	46.3	78.7	15.0
Jind	87.9	96.8	81.0	32.6	43.9	22.2
Fatehabad	97.6	99.9	90.9	45.4	69.6	25.5
Sirsa	97.9	99.4	90.2	39.6	78.6	25.7
Hisar	98.5	99.3	88.7	33.4	83.8	29.3
Bhiwani	99.2	98.6	87.7	37.7	89.4	29.1
